Radiative flux

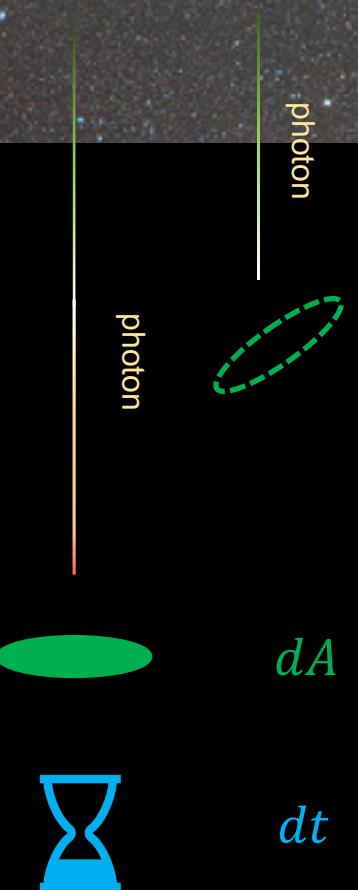

For a detector element (with a photon collecting area dA) exposed to a radiation source for a time interval dt , the number of photons or the amount of energy received is

energy or photon flux

$\text{erg cm}^{-2} \text{ s}^{-1}$
 $\text{ph cm}^{-2} \text{ s}^{-1}$

$$dF \equiv \frac{dE}{dA \ dt}$$

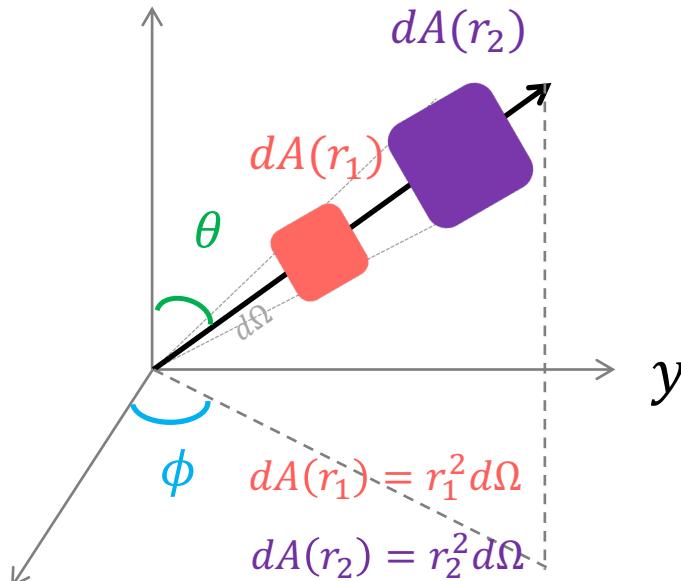

↗
 photon collecting
area (cm^2) ↗
 integration time (s)

F can vary for different orientations of the detector element

Inverse square law

Consider an isotropic source emitting photons/energy equally in all directions (e.g., a spherically symmetric and isolated star)

Conservation of energy (no loss or gain)

$$F(r) = \frac{\text{constant}}{r^2}$$

energy flux ($\text{erg cm}^{-2} \text{ s}^{-1}$)

$$F(r) \equiv \frac{L}{4\pi r^2}$$

luminosity (erg s^{-1})

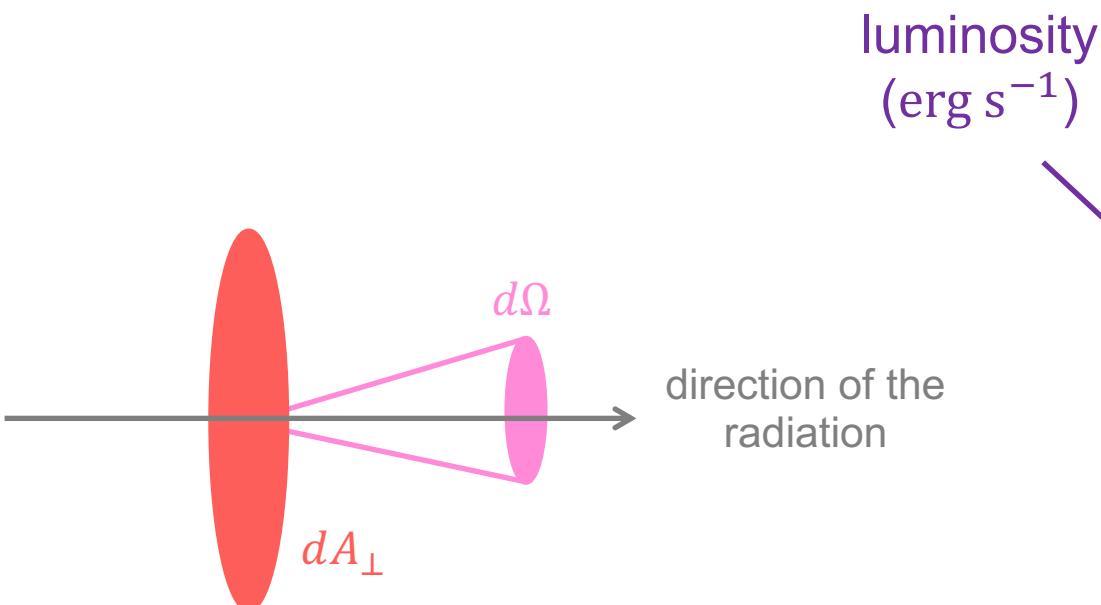

distance to the source (cm)

$$dF(r) = \frac{dE}{dA(r)dt} = \frac{dE}{r^2 d\Omega dt}$$

$$d\Omega = \sin \theta d\theta d\phi$$

Radiative intensity

Since flux changes with distance to the source, it is useful to a concept that is **intrinsic** to the properties of the source, e.g., luminosity (L), intensity (I)

luminosity
(erg s^{-1})

$$L \equiv \frac{dE}{dt}$$

direction of the radiation

dA_{\perp}

$d\Omega$

$I \equiv \frac{dE}{dt \ dA_{\perp} \ d\Omega}$

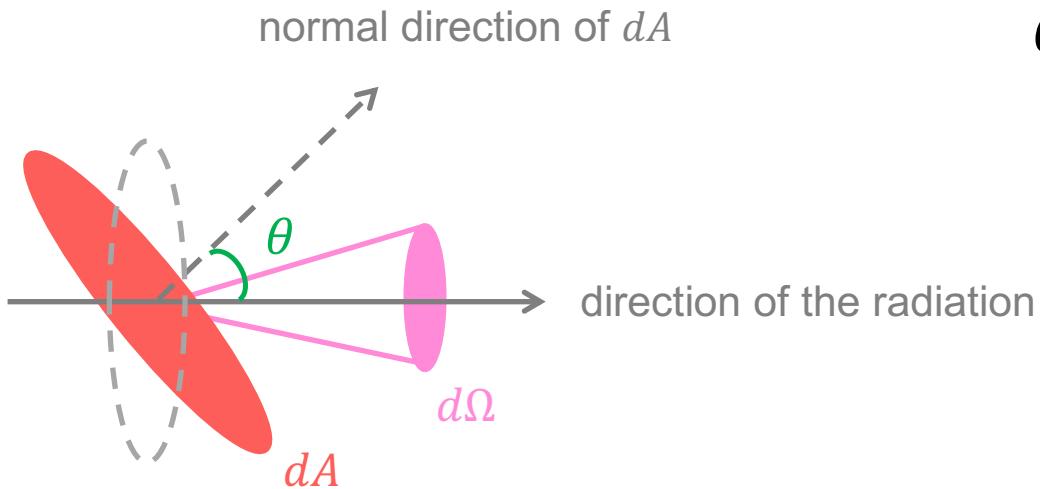

By definition, dA_{\perp} is normal to the direction of the radiation

Solar luminosity

$$L_{\odot} = 3.8 \times 10^{33} \text{ erg s}^{-1}$$

Intensity and flux

Consider a radiation field (radiation in all directions), for a detector element (with photon collecting area dA) at some arbitrary orientation, we have

$$dF = I \cos \theta \, d\Omega$$

effective area: $dA_{\perp} = dA \cos \theta$

prev. sl.

$$I = \frac{dE}{dt \, dA_{\perp} \, d\Omega}$$

prev. sl.

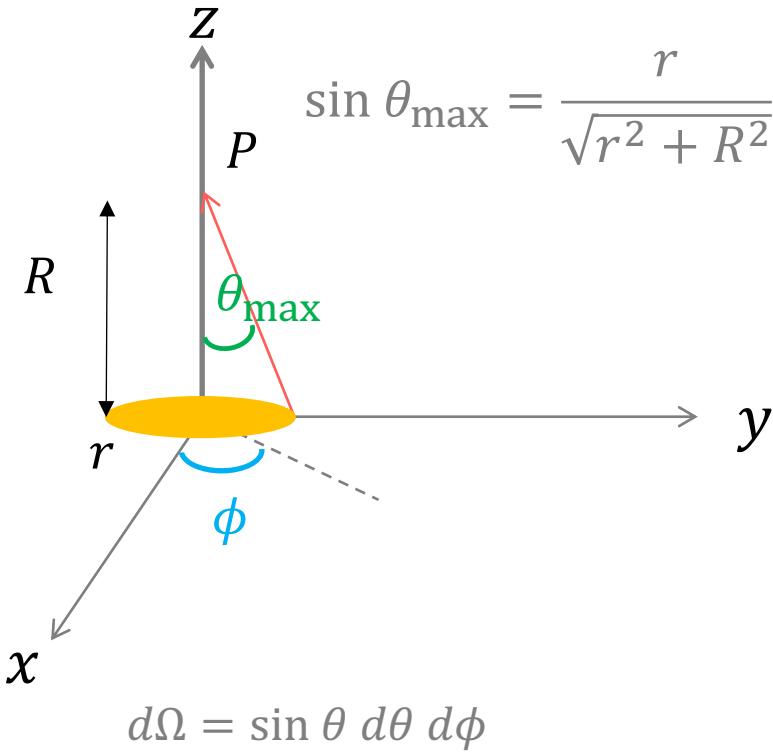

$$dF = \frac{dE}{dt \, dA}$$

Intensity and flux (example #1)

prev. sl.

$$dF = I \cos \theta \, d\Omega$$

For an **isotropic** source $I(\theta, \phi) = \text{const.}$ with a flat sheet geometry (radiation into the upper hemisphere), the radiative flux of at P is

$$F(R) = \int I \cos \theta \, d\Omega = I \int_0^{2\pi} d\phi \int_0^{\theta_{\max}} \cos \theta \sin \theta \, d\theta$$

$$= \pi I \sin^2 \theta_{\max} = \pi I \frac{r^2}{r^2 + R^2}$$

$$\int_0^{2\pi} d\phi = 2\pi$$

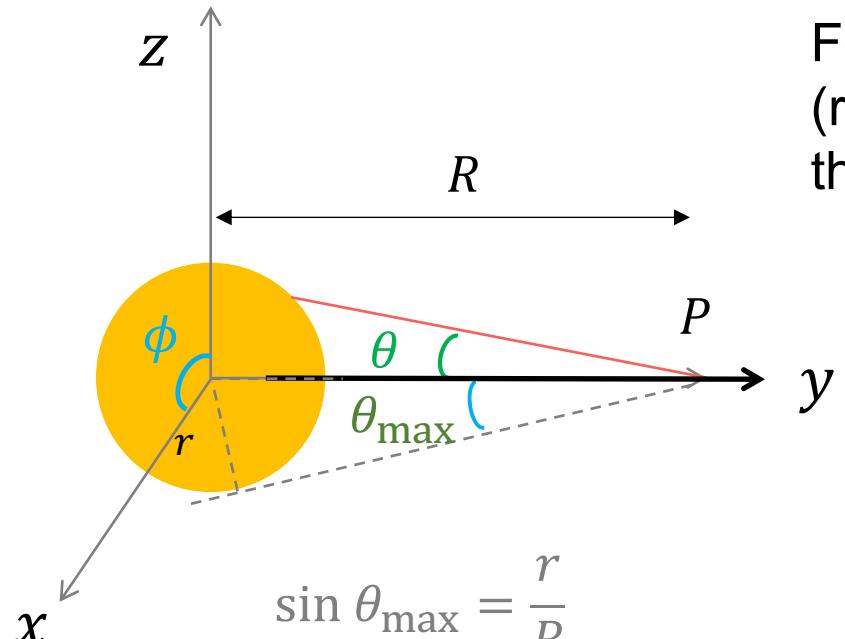

$$F(R = 0) = \pi I$$

$$\int_0^{\pi/2} \cos \theta \sin \theta \, d\theta = \frac{1}{2} \sin^2 \frac{\pi}{2} = \frac{1}{2}$$

Intensity and flux (example #2)

[prev. sl.](#)

$$dF = I \cos \theta d\Omega$$

$$\sin \theta_{\max} = \frac{r}{R}$$

For an **isotropic** source $I(\theta, \phi) = \text{const.}$ with a spherical geometry (radiation from the surface of the sphere and within the sphere but the sphere is not transparent), the radiative flux at P

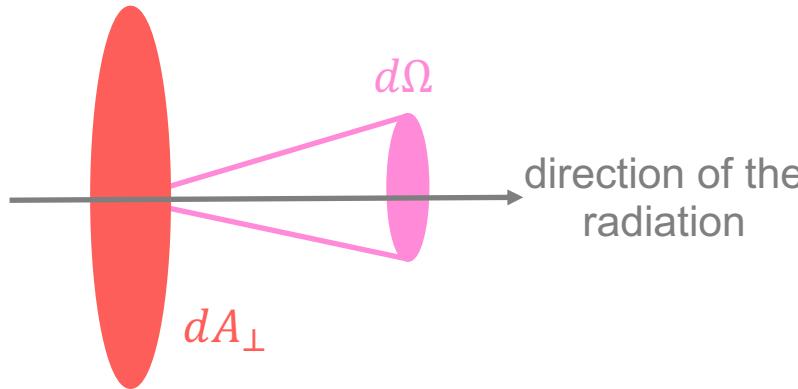

$$\begin{aligned} F(R) &= \int I \cos \theta d\Omega = I \int_0^{2\pi} d\phi \int_0^{\theta_{\max}} \sin \theta \cos \theta d\theta \\ &= \pi I \sin^2 \theta_{\max} = \pi I \left(\frac{r}{R}\right)^2 \\ &\int_0^t \cos \theta \sin \theta d\theta = \frac{\sin^2 t}{2} \end{aligned}$$

At $R = r$ (i.e. the surface of the sphere), we have

$$F = \pi I$$

Specific intensity

Radiative energy in a **specific frequency** crossing unit area (dA_{\perp}) in unit time in unit solid angle

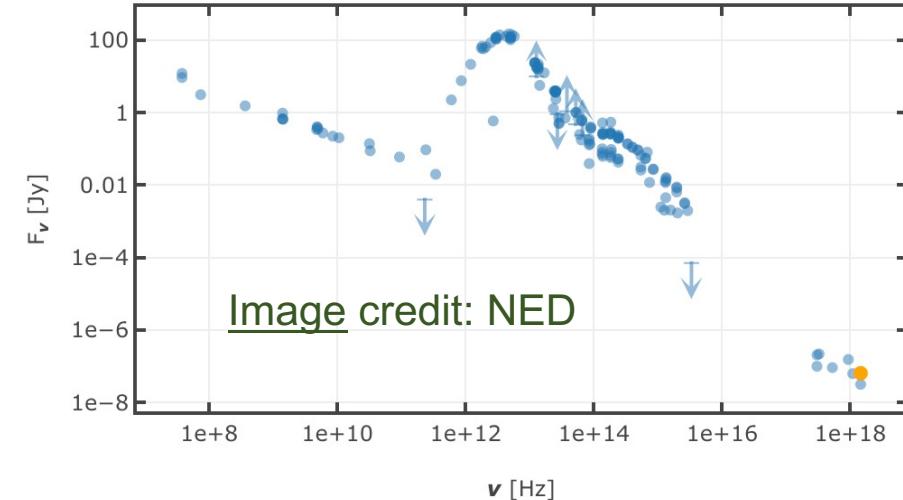

specific intensity

$$dE_{\nu} = I_{\nu} dA d\nu d\Omega dt$$

$$I_{\nu} \equiv \frac{dE_{\nu}}{dA_{\perp} d\nu d\Omega dt}$$

$\text{erg Hz}^{-1} \text{cm}^{-2} \text{s}^{-1} \text{sr}^{-1}$

prev. sl.

$$I = \frac{dE}{dt dA_{\perp} d\Omega}$$

$$I_{\nu} = \frac{\lambda}{\nu} I_{\lambda}$$

Specific flux and momentum

prev. sl.

$$dF = I \cos \theta d\Omega$$

The diagram shows a red elliptical source on the left emitting radiation through a pink cone representing a solid angle $d\Omega$. A horizontal grey line extends from the source, with an arrow pointing to the right labeled "direction of the radiation". A small red vertical rectangle labeled dA_\perp is shown at the bottom left.

$$dF_\nu = I_\nu \cos \theta d\Omega$$

$$I_{\nu}^{\text{out}} = I_{\nu}^{\text{in}} e^{-\tau_{\nu,0}}$$

Radiative transfer equation (no external emission)

prev. sl.

$$I_{\nu}^{\text{out}} = I_{\nu}^{\text{in}} e^{-\tau_{\nu,0}} + \int_0^{\tau_{\nu,0}} S_{\nu}(\tau_{\nu}) e^{-\tau_{\nu}} d\tau_{\nu}$$

Case #2: no external emission ($I_{\nu}^{\text{in}} = 0$)

$$I_{\nu}^{\text{out}} = \int_0^{\tau_{\nu,0}} S_{\nu}(\tau_{\nu}) e^{-\tau_{\nu}} d\tau_{\nu}$$

Chpt.2 Fundamentals of radiation

2.1 Elementary concepts of radiation

2.2 Radiative transfer

2.3 Thermal radiation

2.3.1 Blackbody radiation spectrum

2.3.2 Blackbody emission intensity

2.3.3 Blackbody emission flux

2.3.4 Thermal equilibrium

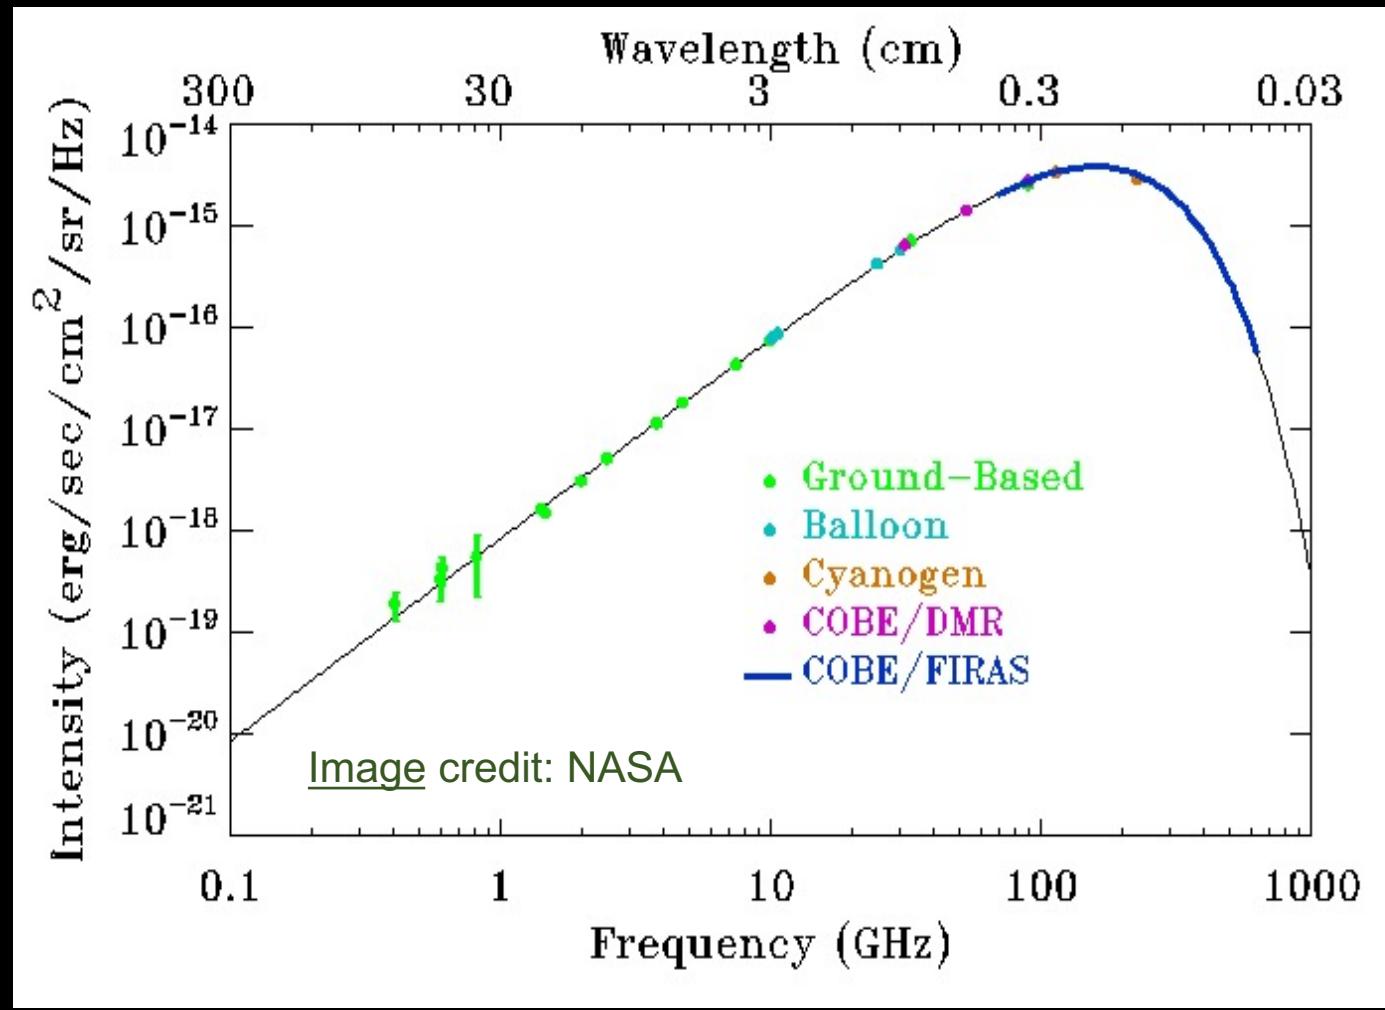

2.3.5 Local thermal equilibrium

2.4 Scattering

2.5 Escape probability

2.6 Polarization

2.7 Dispersion and rotation measures

Blackbody radiation spectrum

Thermal radiation is radiation emitted by matter in thermal equilibrium. In this case, the free electrons follows the Maxwellian distribution

$$f(v)dv = 4\pi \left(\frac{m_e}{2\pi k T_e}\right)^{3/2} v^2 \exp\left(-\frac{m_e v^2}{2k T_e}\right)$$

Blackbody radiation spectrum is the **Planck spectrum**

$$h\nu_{\max} = 2.82 kT$$

$$B_\nu(T) = \frac{2h\nu^3}{c^2} \left(\exp\left(\frac{h\nu}{kT}\right) - 1 \right)^{-1}$$

$$B_\lambda(T) = \frac{2hc^2}{\lambda^5} \left(\exp\left(\frac{hc}{\lambda kT}\right) - 1 \right)^{-1}$$

Caution that even if particles in the matter follow the Maxwellian distribution, radiation emitted by this matter does **not** necessarily have to be thermal radiation

Blackbody emission intensity

$$I_{\nu}^{\text{BB}} \equiv B_{\nu}(T) = \frac{2h\nu^3}{c^2} \left(\exp\left(\frac{h\nu}{kT}\right) - 1 \right)^{-1}$$

Blackbody emission intensity

$$I^{\text{BB}} = \int_0^{\infty} \frac{2h\nu^3}{c^2} \left(\exp\left(\frac{h\nu}{kT}\right) - 1 \right)^{-1} d\nu$$

$$= \frac{2k^4 T^4}{h^3 c^2} \int_0^{\infty} x^3 (e^x - 1)^{-1} dx$$

$$x = \frac{h\nu}{kT}$$

Blackbody emission flux

prev. sl.

$$I^{\text{BB}} = \frac{2k^4 T^4}{h^3 c^2} \int_0^\infty x^3 (e^x - 1)^{-1} dx$$

Blackbody emission flux

$$\rightarrow F^{\text{BB}} = \pi I^{\text{BB}} = \sigma T^4$$

Blackbody radiation flux depends
only on the temperature

$$\int_0^\infty x^3 (e^x - 1)^{-1} dx = \frac{\pi^4}{15}$$
$$\sigma = \frac{2\pi^5 k^4}{15 h^3 c^2}$$
$$= 5.670 \times 10^{-5} \text{ erg s}^{-1} \text{cm}^{-2} \text{K}^{-4}$$

↑
Stefan-Boltzmann
constant

Asymptotic behavior

prev. sl.

$$I_{\nu}^{\text{BB}} = B_{\nu}(T) = \frac{2h\nu^3}{c^2} \left(\exp\left(\frac{h\nu}{kT}\right) - 1 \right)^{-1}$$

$$\frac{h\nu}{kT} \ll 1 \quad \exp\left(\frac{h\nu}{kT}\right) - 1 \rightarrow \frac{h\nu}{kT} \quad I_{\nu}^{\text{RJ}} = \frac{2\nu^2}{c^2} kT \quad \text{Rayleigh-Jeans Law}$$

$$\frac{h\nu}{kT} \gg 1 \quad \exp\left(\frac{h\nu}{kT}\right) - 1 \rightarrow \exp\left(\frac{h\nu}{kT}\right) \quad I_{\nu}^{\text{W}} = \frac{2h\nu^3}{c^2} \exp\left(-\frac{h\nu}{kT}\right) \quad \text{Wien Law}$$

Thermodynamic Equilibrium (TE)

prev. sl.

$$I_{\nu}^{\text{BB}} = B_{\nu}(T) = \frac{2h\nu^3}{c^2} \left(\exp\left(\frac{h\nu}{kT}\right) - 1 \right)^{-1}$$

For medium in thermodynamic equilibrium, Kirchoff's law links the spontaneous emission coefficient and emission source function with Planck's law

$$j_{\nu} \equiv \alpha_{\nu} B_{\nu}(T)$$

$$S_{\nu} \equiv B_{\nu}(T)$$

TE (cont.)

prev. sl.

$$I_\nu^{\text{out}} = \int_0^{\tau_{\nu,0}} S_\nu(\tau_\nu) e^{-\tau_\nu} d\tau_\nu$$

$$I_\nu^{\text{out}} = B_\nu(T)(1 - \exp(-\tau_{\nu,0}))$$

$$\tau_{\nu,0} = \int \alpha_\nu dl \gg 1$$

$$I_\nu^{\text{out}} = B_\nu(T)$$

$$\tau_{\nu,0} = \int \alpha_\nu dl \ll 1$$

$$I_\nu^{\text{out}} = \tau_{\nu,0} B_\nu(T)$$

Only if the medium is in TE and it is optically thick, then its radiation follows the Planck's Law. For non-thermal processes, the source function can only be derived from j_ν and α_ν .

Local Thermodynamic Equilibrium (LTE)

LTE differs from TE in that the radiation field does not need to follow Planck's law, i.e., $I_\nu \neq B_\nu(T)$.

The assumption of LTE is valid if either of the follow two applies:

- collisional processes among particles dominate photon-related processes
- collisional processes among particles are in equilibrium with photo-related processes

Scattering

Scattering significantly complicates the radiative transfer.

Scattering can change the direction **and frequency** of the incident photon.

Two-level system

Pure scattering

Consider a medium has only isotropic scattering (no emission or absorption), which only changes the direction of the incident photon

$$\frac{dI_\nu}{dl} = -\sigma_\nu^{\text{sca}} I_\nu + \sigma_\nu^{\text{sca}} S_\nu^{\text{sca}}$$

scattered outside
the line of sight

scattered back into
the line of sight

scattering coefficient

$$\frac{dI_\nu}{d\tau_\nu^{\text{sca}}} = -I_\nu + S_\nu^{\text{sca}}$$

scattering optical depth

$$d\tau_\nu^{\text{sca}} \equiv \sigma_\nu^{\text{sca}} dl$$

Source function for scattering

Random walk

The mean displacement traveled by photons is
(order-of-magnitude estimation)

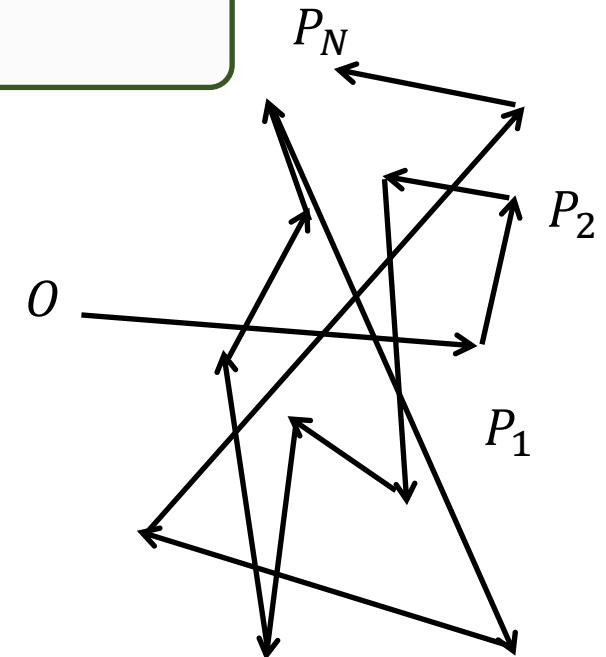

see Sect. 1.7 of the REF book
(p35) by Rybicki & Lightman

$$\bar{l}_\nu^{\text{RM}} \sim \sqrt{N} \bar{l}_\nu \quad \leftarrow \bar{l}_\nu = \frac{1}{\sigma_\nu^{\text{sca}}} : \text{scattering mean free path}$$

Number of scattering \downarrow size scale of the medium \downarrow

for $\tau_\nu^{\text{sca}} \gg 1$ $N \sim \frac{L^2}{\bar{l}_\nu^2} = (\sigma_\nu^{\text{sca}} L)^2 \sim (\tau_\nu^{\text{sca}})^2$

for $\tau_\nu^{\text{sca}} \ll 1$ $N \sim \sigma_\nu^{\text{sca}} L \sim \tau_\nu^{\text{sca}}$

Emission + absorption + scattering

Considering scattering + absorption + emission for a medium in TE

$$\frac{dI_\nu}{dl} = -\sigma_\nu^{\text{sca}} I_\nu + \sigma_\nu^{\text{sca}} S_\nu^{\text{sca}} + j_\nu - \alpha_\nu I_\nu$$
$$\frac{dI_\nu}{dl} = -(\sigma_\nu^{\text{sca}} + \alpha_\nu) I_\nu + (\sigma_\nu^{\text{sca}} S_\nu^{\text{sca}} + \alpha_\nu B_\nu)$$

$$\frac{dI_\nu}{d\tau_\nu^{\text{AS}}} = -I_\nu + S_\nu^{\text{EAS}}$$

$$S_\nu^{\text{EAS}} \equiv \frac{\alpha_\nu B_\nu + \sigma_\nu^{\text{sca}} S_\nu^{\text{sca}}}{\alpha_\nu + \sigma_\nu^{\text{sca}}}$$

$$(\sigma_\nu^{\text{sca}} + \alpha_\nu)dl = d\tau_\nu^{\text{AS}}$$

Source function for emission,
absorption, and scattering

Absorption and scattering probability

An alternative way to define the source function

$$S_\nu^{\text{EAS}} = \frac{\alpha_\nu B_\nu + \sigma_\nu^{\text{sca}} S_\nu^{\text{sca}}}{\alpha_\nu + \sigma_\nu^{\text{sca}}}$$

Introducing absorption and scattering probabilities

absorption probability

$$\epsilon_\nu \equiv \frac{\alpha_\nu}{\alpha_\nu + \sigma_\nu^{\text{sca}}}$$

scattering probability

$$1 - \epsilon_\nu = \frac{\sigma_\nu^{\text{sca}}}{\alpha_\nu + \sigma_\nu^{\text{sca}}}$$

$$S_\nu^{\text{EAS}} = \epsilon_\nu B_\nu + (1 - \epsilon_\nu) S_\nu^{\text{sca}}$$

Effective mean free path

prev. sl.

$$\epsilon_\nu = \frac{\alpha_\nu}{\alpha_\nu + \sigma_\nu^{\text{sca}}}$$

After $N = \epsilon_\nu^{-1}$ steps, a photon is **truly** absorbed

$$\bar{l}_\nu^{\text{AS}} = \frac{1}{\alpha_\nu + \sigma_\nu^{\text{sca}}} : \text{mean free path}$$

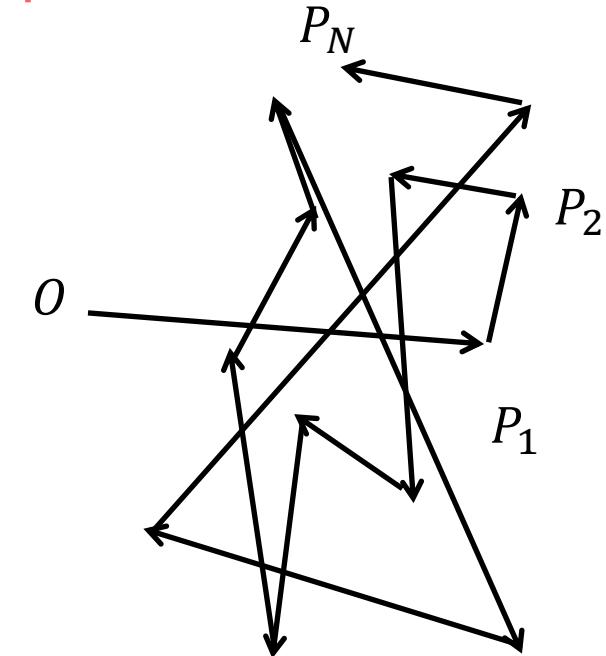

$$(\bar{l}_\nu^{\text{RM}})^2 = N (\bar{l}_\nu^{\text{AS}})^2 = \frac{(\bar{l}_\nu^{\text{AS}})^2}{\epsilon_\nu} = \frac{1}{\alpha_\nu(\alpha_\nu + \sigma_\nu^{\text{sca}})}$$

effective mean free path
diffusion length
thermalization length

$$l_\nu^{\text{eff}} = \frac{1}{\sqrt{\alpha_\nu(\alpha_\nu + \sigma_\nu^{\text{sca}})}}$$

for $\alpha_\nu \ll \sigma_\nu^{\text{sca}}$

$$l_\nu^{\text{eff}} = \frac{1}{\sqrt{\alpha_\nu \sigma_\nu^{\text{sca}}}}$$

Chpt.2 Fundamentals of radiation

Polarization

Polarization describes the specific orientation of the wave perpendicular to the propagation direction of (unpolarized wave has no particular orientation).

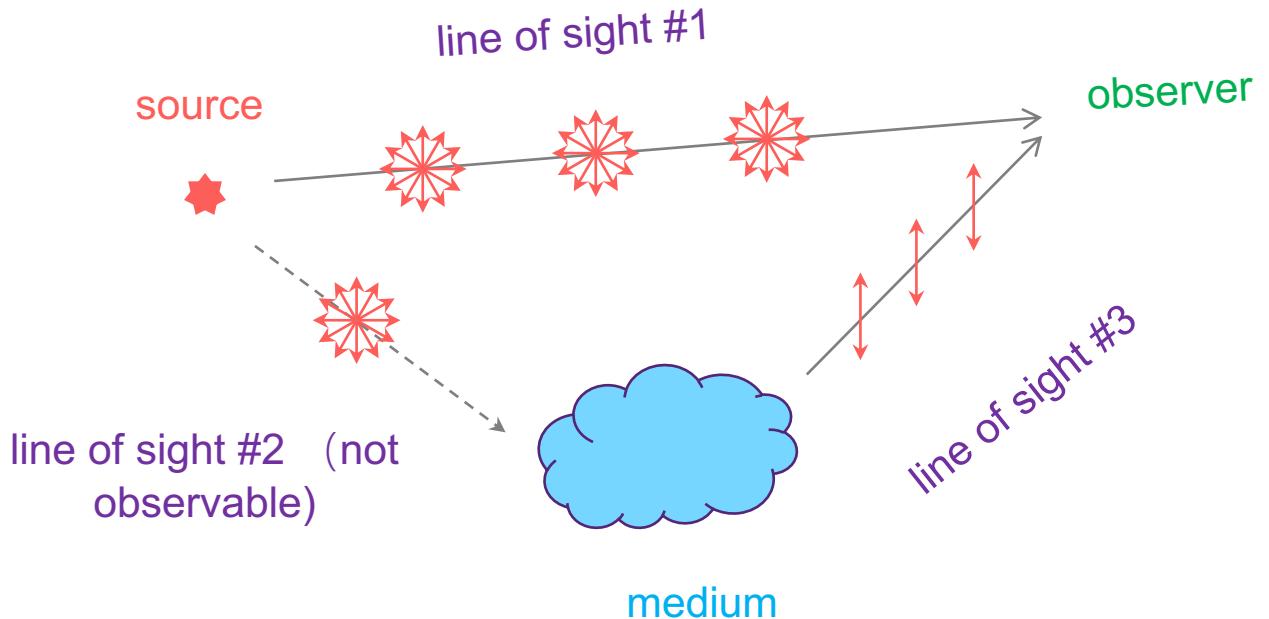

PolarLight ([Feng et al. 2020](#)), launched in 2018, reopened the soft X-ray polarization window. Before PolarLight, the Crab nebula was the only celestial object with a statistically significant detection in soft X-ray polarimetry, firstly measured in the 1970s (e.g., [Novick et al. 1972](#)).

Why polarization

- ✓ Measure magnetic field
 - Faraday rotation
- ✓ Probe emission mechanism
 - e.g., cyclotron and synchrotron emissions
- ✓ Explore birefringence nature
 - e.g., CMB and cosmic inflation
- ✓ Constrain unresolved geometry

Astrobites Guide to Polarimetry

by Briley Lewis | Oct 23, 2022 | Guides | 0 comments

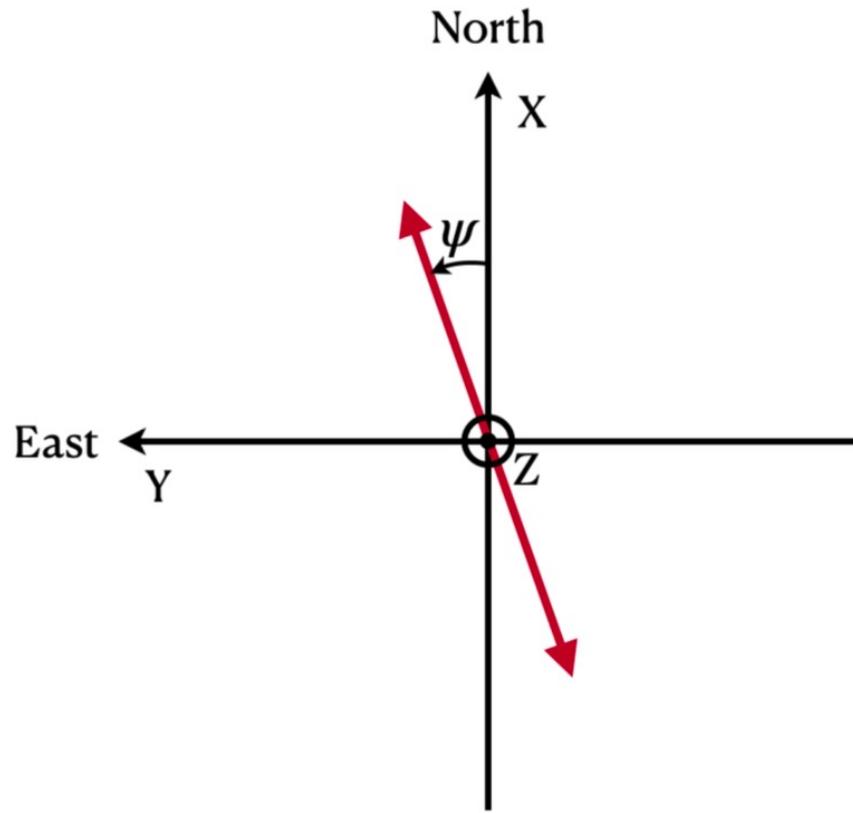

see a list of polarimetry instruments in the above [astrobites](#)

Gemini Planet Imager — Briefly mentioned earlier, the Gemini Planet Imager didn't just image planets, it also imaged debris disks! And it did so in polarized light, using polarimetric differential imaging, a technique that separates the starlight from the disk's light. They've got a whole survey sample of polarized debris disks, plus some neat in-depth studies of individual disks!

- New detections of exoplanet HD 95086 b with the Gemini Planet Imager
- A Deeper Look into the Atmospheres of HR8799 c and d with GPI

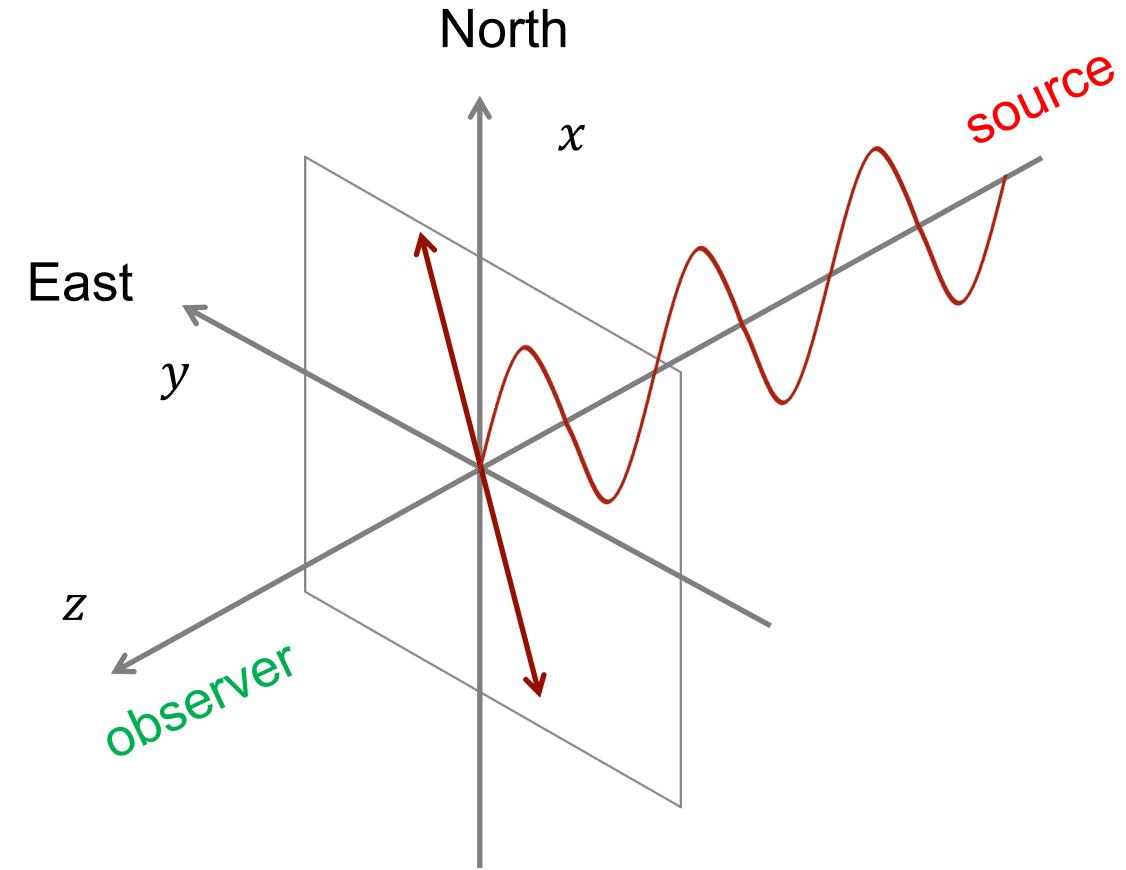

IAU standard of polarization

IAU reference frame for polarization
(e.g., [Ferriere et al. 2021](#))

IAU definition:

- ✓ X and Y are the Cartesian coordinates of the plane of the sky
- ✓ Z is along the line of sight (+Z towards the observer)
- ✓ ψ : linear polarization angle (measured counterclockwise from the North)

Stokes parameters

Stokes parameters, all related to intensity, are **observable**

- I : Intensity
- $\sqrt{Q^2 + U^2}$: Intensity of linear polarization
- V : Intensity of circular polarization

$$S_0 \equiv I$$

$$S_1 \equiv Q = Ip \cos 2\chi \cos 2\psi$$

$$S_2 \equiv U = Ip \cos 2\chi \sin 2\psi$$

$$S_3 \equiv V = Ip \sin 2\chi$$

$$p = \sqrt{Q^2 + U^2 + V^2}/I$$

polarization fraction

$$\tan 2\chi = \frac{V}{\sqrt{Q^2 + U^2}}, -\frac{\pi}{4} \leq \chi \leq \frac{\pi}{4}$$

$$\tan 2\psi = U/Q, 0 \leq \psi \leq \pi$$

linear polarization angle

$p = 1$	completely polarized
$0 < p < 1$	partially polarized
$p = 0$	unpolarized

Poincaré sphere

[prev. sl.](#)

$$S_0 \equiv I$$

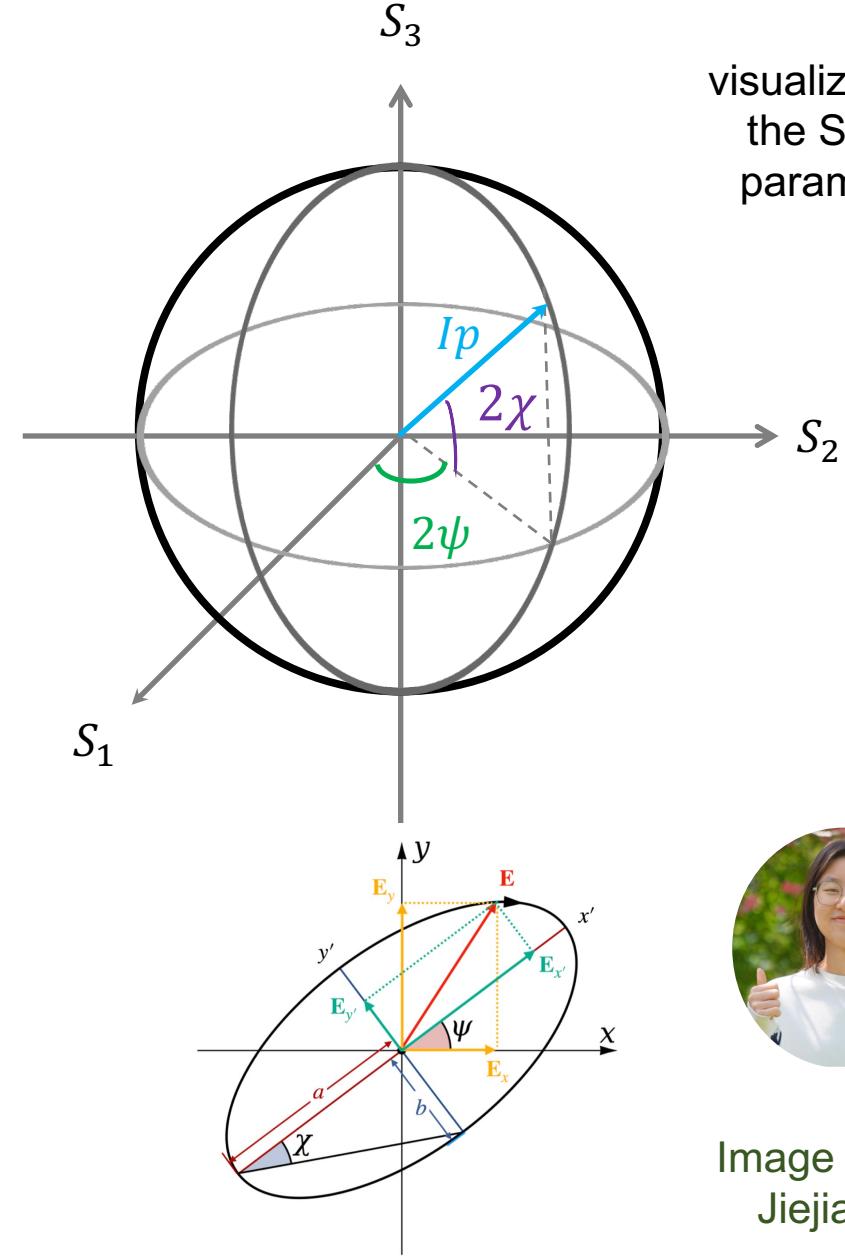

$$S_1 \equiv Q = Ip \cos 2\chi \cos 2\psi$$

$$S_2 \equiv U = Ip \cos 2\chi \sin 2\psi$$

$$S_3 \equiv V = Ip \sin 2\chi$$

$$\tan 2\chi = \frac{V}{\sqrt{Q^2 + U^2}}, -\frac{\pi}{4} \leq \chi \leq \frac{\pi}{4}$$

$$\tan 2\psi = U/Q, 0 \leq \psi \leq \pi$$

Jiejia Liu

Linear polarization

For $V = 0$ ($\chi = 0$), we have the linear polarization

$$S_0 = I$$

$$S_1 = Q = Ip \cos 2\psi$$

$$S_2 = U = Ip \sin 2\psi$$

$$S_3 = V = 0$$

prev. sl.

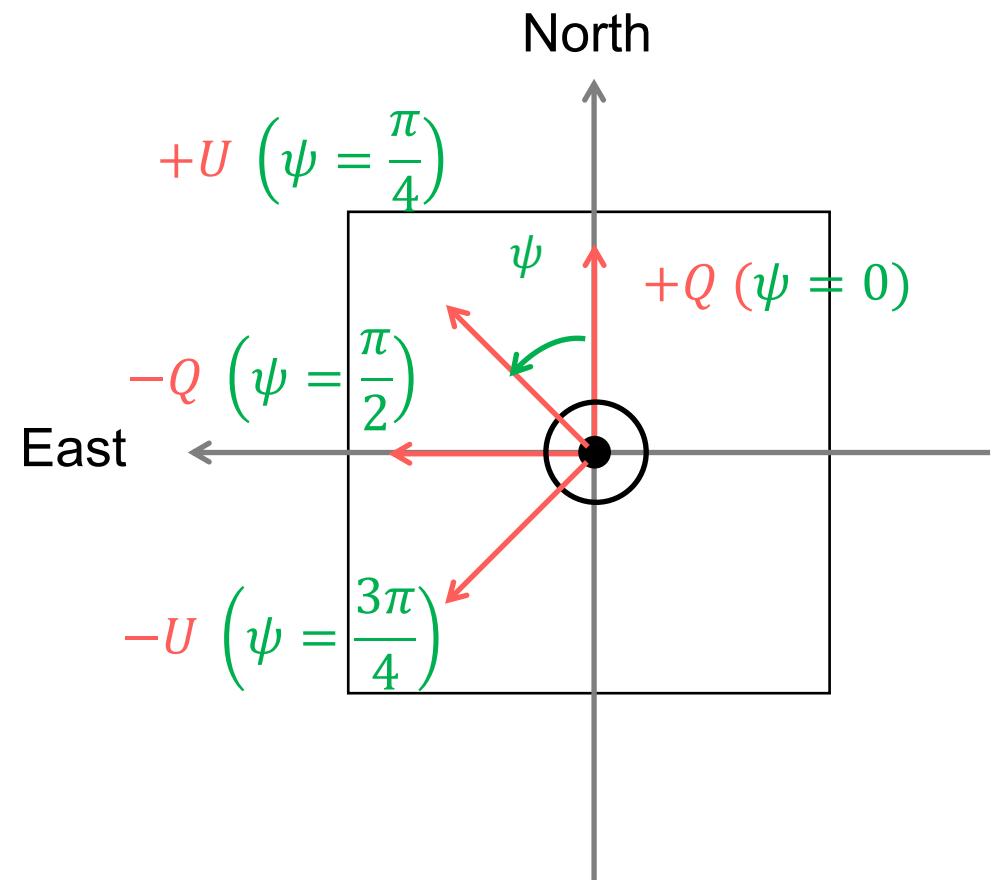

$$S_3 \equiv V = Ip \sin 2\chi$$

$$\tan 2\psi = U/Q$$

linear polarization angle

$$\cos \pi = -1$$

$$\sin \left(\frac{3\pi}{2} \right) = -1$$

e.g., [Hamaker & Bregman \(1996\)](#)

Circular polarization

For $Q = U = 0$ ($\chi = \pm\pi/4$), we have the circular polarization

$$S_0 = I$$

$$S_1 = Q = 0$$

$$S_2 = U = 0$$

$$S_3 = V = Ip \sin 2\chi$$

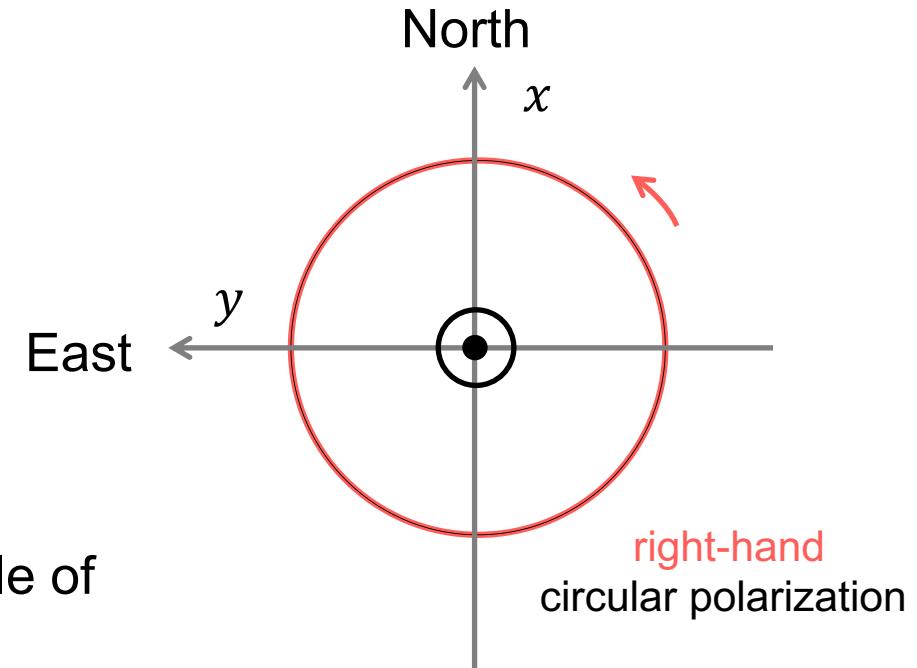

IAU definition:

- ✓ $+V$ for the **right-handed** circular polarization
- ✓ For the **right-handed** circular polarization, the position angle of \vec{E} at any point **increases** with time
- ✓ Along the $+z$ direction, \vec{E} traces a **left-handed** circle at any time

prev. sl.

$$S_1 \equiv Q = Ip \cos 2\chi \cos 2\psi$$

$$S_2 \equiv U = Ip \cos 2\chi \sin 2\psi$$

e.g., Hamaker & Bregman (1996)

Linear/circular polarization fraction

$$\begin{pmatrix} I \\ Q \\ U \\ V \end{pmatrix} = \begin{pmatrix} I - pI \\ 0 \\ 0 \\ 0 \end{pmatrix} + \begin{pmatrix} pI \\ Q \\ U \\ V \end{pmatrix}$$

$$\begin{pmatrix} I \\ Q \\ U \\ V \end{pmatrix} = \begin{pmatrix} I - p_L I - p_C I \\ 0 \\ 0 \\ 0 \end{pmatrix} + \begin{pmatrix} p_L I \\ Q \\ U \\ 0 \end{pmatrix} + \begin{pmatrix} p_C I \\ 0 \\ 0 \\ V \end{pmatrix}$$

prev. sl.

- $p = 1$ completely polarized
- $0 < p < 1$ partially polarized
- $p = 0$ unpolarized

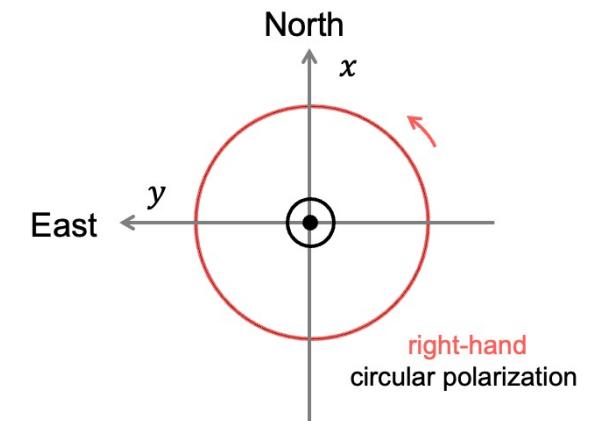

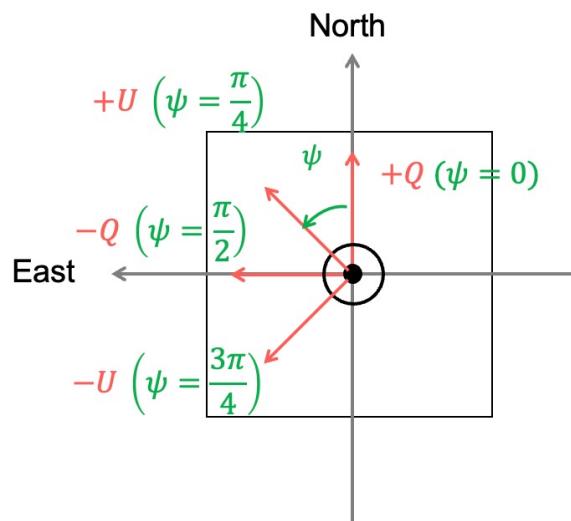

polarization fraction

linear
or
circular
polarization
fraction

$$p = \sqrt{Q^2 + U^2 + V^2}/I$$

$$p_L = \sqrt{Q^2 + U^2}/I$$

$$p_C = V/I$$

Ferriere et al. 2021

Dispersion relation

Consider a pair of left- and right-handed circularly polarized waves propagate along the B-field with $\vec{k} \parallel \vec{B}$, the dispersion relation is

Eq. 1 of Ferriere et al. 2021

$$\omega^2 = c^2 k^2 + \frac{\omega_p^2}{1 \mp \frac{\omega_L}{\omega}}$$

angular frequency $\omega = 2\pi\nu$ wave number $k = \frac{2\pi}{\lambda}$

- Right circular polarized (RCP) mode: –
- Left circular polarized (LCP) mode: +

plasma frequency

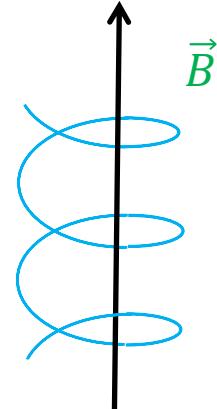

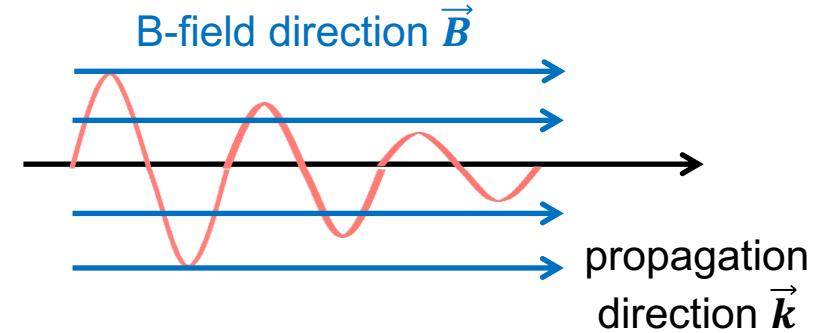

$$\omega_p \equiv \sqrt{\frac{4\pi n_e e^2}{m_e}}$$

gyro motion

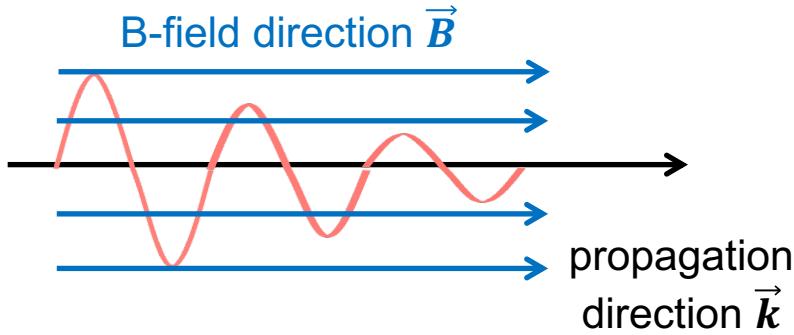

Larmor (or gyro) frequency

$$\omega_L \equiv \frac{eB}{m_e c}$$

《原子物理学》杨福家
3rd edition, p153 - 155

Dispersion relation (cont.)

For astrophysical waves of interest, the following always apply (Assignment #3: Plasma frequency)

$$\omega_p \ll \omega, \quad \omega_L \ll \omega$$

prev. sl.

$$\omega_p \equiv \sqrt{\frac{4\pi n_e e^2}{m_e}}$$

plasma frequency

$$\omega_L \equiv \frac{eB}{m_e c}$$

Larmor frequency

prev. sl.

$$\omega^2 = c^2 k^2 + \frac{\omega_p^2}{1 \mp \frac{\omega_L}{\omega}}$$

$$\frac{1}{1+x} = 1 - x + \dots$$

$$= c^2 k^2 + \omega_p^2 \pm \frac{\omega_p^2 \omega_L}{\omega}$$

$$\begin{array}{ccc} \uparrow & \uparrow & \uparrow \\ \text{EM wave} & \text{electric} & \text{magnetic} \\ \text{in free space} & \text{force} & \text{force} \end{array}$$

$$c^2 k^2 = \omega^2 - \omega_p^2 \mp \frac{\omega_p^2 \omega_L}{\omega} \simeq \omega^2$$

$$k(\omega) = \frac{\omega}{c} \sqrt{1 - \frac{\omega_p^2}{\omega^2} \mp \frac{\omega_p^2 \omega_L}{\omega^3}}$$

Refractive index

Consider the propagation of EM waves through an unmagnetized plasma (mainly free electrons), the medium refractive index is

$$n = \sqrt{1 - \frac{\omega_p^2}{\omega^2}}$$

see Sect. 8.1 of the
REF book (p227) by
Rybicki & Lightman

prev. sl.

$$\omega_p \equiv \sqrt{\frac{4\pi n_e e^2}{m_e}}$$

plasma frequency

Only waves with $\omega > \omega_p$ can propagate, which is not an issue in most cases

$$v_\phi = \frac{\omega}{k} = \frac{c}{n}$$

↑
phase velocity

Time of arrival difference

Consider a pulse propagates in a non-magnetized medium ($B = 0, \omega_L = 0$), the group velocity is

$$v_{\text{grp}}(\omega) = \frac{d\omega}{dk} = \frac{c^2 k}{\omega} = c \sqrt{1 - \frac{\omega_p^2}{\omega^2}}$$

This leads to a frequency-dependent time of arrival

$$t_{\text{arv}}(\omega) = \int_0^l \frac{1}{v_{\text{grp}}(\omega)} dl = \int_0^l \frac{1}{c} \left(1 + \frac{\omega_p^2}{2\omega^2} \right) dl$$

prev. sl.

$$c^2 k^2 = \omega^2 - \omega_p^2 \mp \frac{\omega_p^2 \omega_L}{\omega} \simeq \omega^2$$

prev. sl.

$$\omega_p \equiv \sqrt{\frac{4\pi n_e e^2}{m_e}} \quad \omega_L \equiv \frac{eB}{m_e c}$$

plasma frequency

Larmor frequency

$$\frac{1}{\sqrt{1-x}} = 1 + \frac{x}{2} + \dots$$

Dispersion measure

For $\omega \gg \omega_p$ (Assignment #3: Plasma frequency), the time of arrival for a specific frequency is

traveling distance in the medium

prev. sl.

$$t_{\text{arv}}(\omega) = \int_0^l \frac{1}{c} \left(1 + \frac{\omega_p^2}{2\omega^2} \right) dl$$

prev. sl.

$$\omega_p \equiv \sqrt{\frac{4\pi n_e e^2}{m_e}}$$

plasma frequency

Waves with different frequencies arrive at different times

$$\Delta t_{\text{arv}} = \frac{2\pi e^2}{m_e c} \left(\frac{1}{\omega_{\text{low}}^2} - \frac{1}{\omega_{\text{high}}^2} \right) \int_0^l n_e dl$$

High-frequency waves arrive earlier than the low-frequency ones

Fast Radio Bursts (FRBs)

FRBs are radio bursts with extremely short duration (a few milliseconds) yet rather energetic ($\gtrsim 10 L_\odot$). The first FRB was discovered in 2001 ([Lorimer et al. 2007](#))

prev. sl.

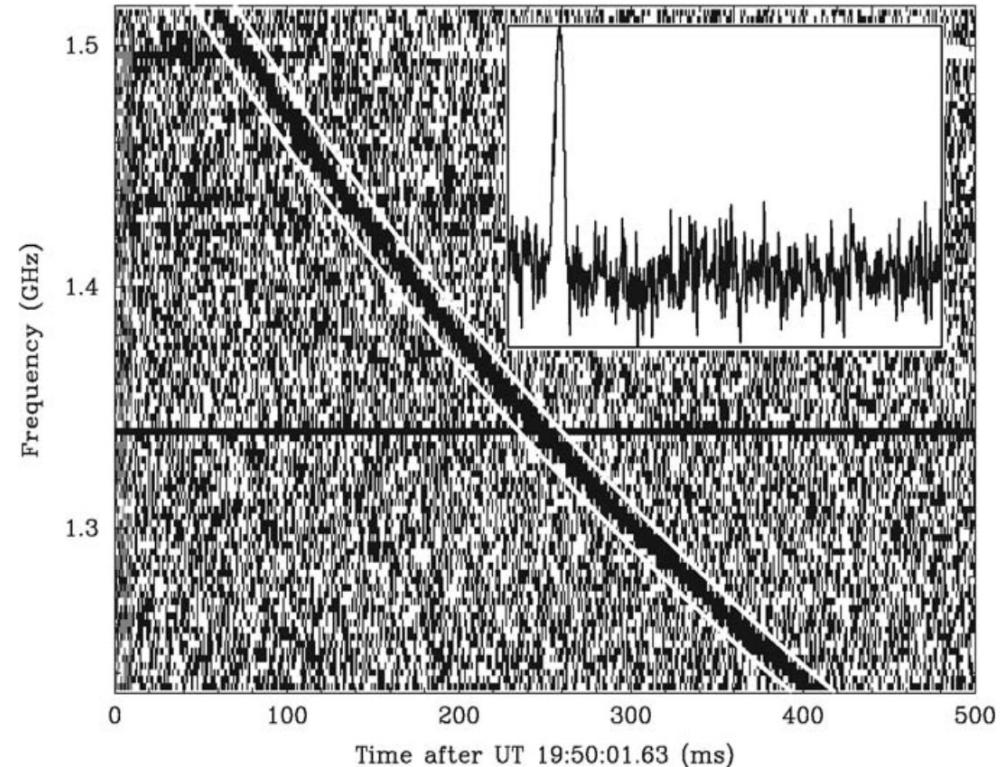

$$\Delta t_{\text{arr}} = \frac{2\pi e^2}{m_e c} \left(\frac{1}{\omega_{\text{low}}^2} - \frac{1}{\omega_{\text{high}}^2} \right) \int_0^l n_e dl$$

Dispersion Measure (DM)

$$= \frac{4.149}{\text{ms}} \left(\left(\frac{1 \text{ GHz}}{\nu_{\text{low}}} \right)^2 - \left(\frac{1 \text{ GHz}}{\nu_{\text{high}}} \right)^2 \right) \left(\frac{\text{DM}}{\text{pc cm}^{-3}} \right)$$

Waterfall plot
measured DM = $375 \pm 1 \text{ pc cm}^{-3}$

[Lorimer et al. 2007](#)

Fast Radio Bursts (FRBs)

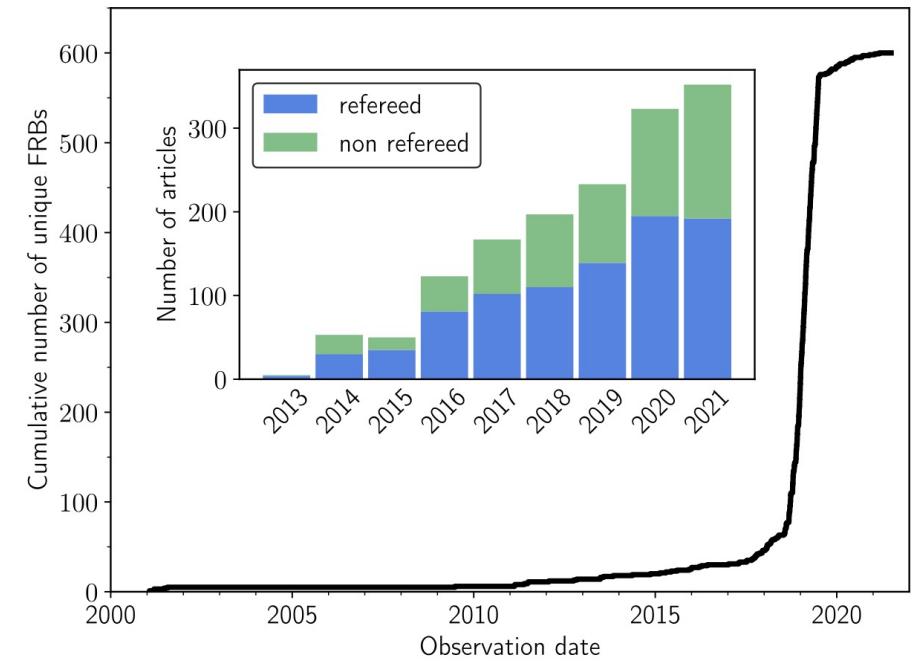

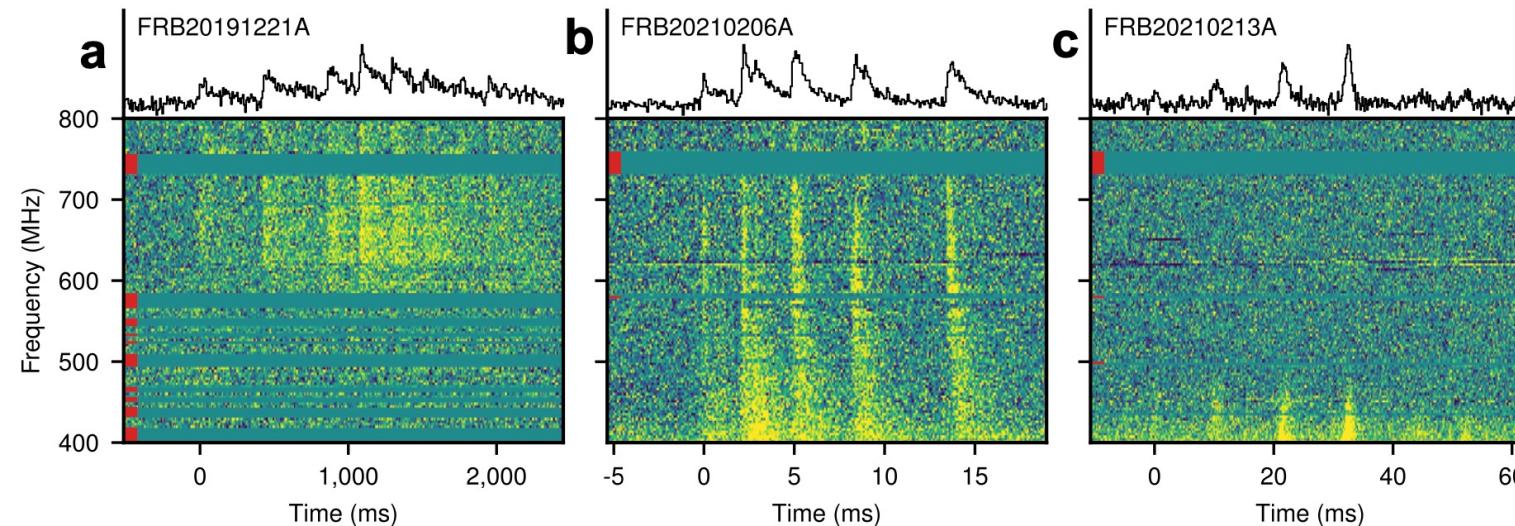

FRBs have been put in the spot light in the past decade:

- Repeating FRBs
- FRBs with known hosts
- FRBs with relatively long durations (slow)

But, we still don't know much about FRBs ...

repeating FRBs (a small yet growing population)

Petroff et al. 2022

Some “not so fast” fast radio bursts

by Alice Curtin | Nov 22, 2022 | Daily Paper Summaries | 1 comment

Title: Four New Fast Radio Bursts Discovered in the Parkes 70-cm Pulsar Survey Archive

Authors: F. Crawford, S. Hisano, M. Golden, T. Kikunaga, A. Laity, D. Zoeller

First Author's Institution: Franklin & Marshall College

Phase difference

In a homogeneous plasma, the phase can be defined as one of the following

Eq. 4 of Ferriere et al. 2021

$$\phi \equiv \omega t - \int_0^l k dl$$

Decomposing a linearly polarized wave into a pair of left- and right-hand circular polarized waves. At the source ($l = 0$), the two waves have the same phase, as the waves propagates (with $\vec{k} \parallel \vec{B}$) in a magnetized medium, phase difference will occur

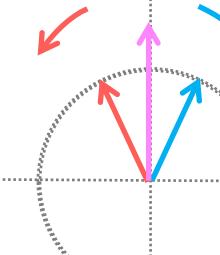

prev. sl.

$$k = \frac{\omega}{c} \sqrt{1 - \frac{\omega_p^2}{\omega^2} \mp \frac{\omega_p^2 \omega_L}{\omega^3}}$$

$$\phi_{RCP} > \phi_{LCP}$$

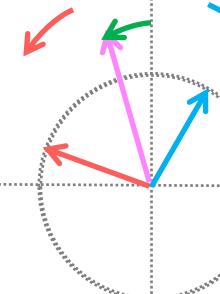

$$\vec{k} \parallel \vec{B}$$

t_0

$$\Delta\psi = \frac{1}{2} \Delta\phi$$

t_1

- Right circular polarized (RCP) mode: –
- Light circular polarized (LCP) mode: +

Phase difference introduced by B-field

Eq. 4 of [Ferriere et al. 2021](#)

$$\phi \equiv \omega t - \int_0^l k dl$$

prev. sl.

$$k = \frac{\omega}{c} \sqrt{1 - \frac{\omega_p^2}{\omega^2} \mp \frac{\omega_p^2 \omega_L}{\omega^3}}$$

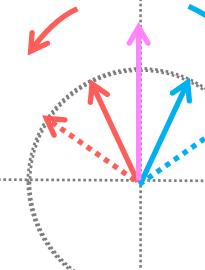

When $B = 0$, $\omega_L = \frac{eB}{m_0 c} = 0$, there is no phase difference

$$k_{\text{RCP}} = k_{\text{LCP}}$$
$$\Delta\phi \equiv \phi_{\text{RCP}} - \phi_{\text{LCP}} = 0$$

\vec{k}

$$t_0 = t_1$$

- \vec{B} points away from the observer: - 

Cosmic Microwave Background

CMB is the leftover radiation from the Big Bang. It was firstly predicted by Gamow (1948).

In 1965, CMB was observed by Arno Penzias and Robert Wilson using the 6-meter Holmdel Horn Antenna.

Cosmic Microwave Background polarization

CMB is linearly polarized (E-mode and B-mode), firstly detected in 2002 ([Kovac et al. 2002](#)).

Birefringence: the refractive index depends on the polarization direction. Typically, double refraction (ordinary and extraordinary indices)

[Komatsu \(2022, review\)](#): β is the cosmic-birefringence-induced rotation angle

- B-mode (curl-like)
 - $\perp \vec{k}$ or $\parallel \vec{k}$
 - dominated by density perturbation
- E-mode (gradient-like)
 - 45° w. r. t. \vec{k}
 - fingerprints of GW background (too faint to detect directly nowadays) from cosmic inflation

CMB B-mode

The detection of B-mode polarization will provide strong constraints for cosmic inflationary models.

The B-mode power is $\propto r^2$, where, $r < 0.07$ is the tensor-to-scalar ratio (BICEP2 collaboration 2016).
