Electric and magnetic field of an accelerated charge

Consider a moving point charge, its electric and magnetic fields are

$$\vec{E}(r, t) = \frac{q}{\kappa^3 R^2} (\vec{e}_R - \vec{\beta})(1 - \beta^2) + \frac{q}{c \kappa^3 R} \vec{e}_R \times \left((\vec{e}_R - \vec{\beta}) \times \frac{\partial \vec{\beta}}{\partial t} \right)$$

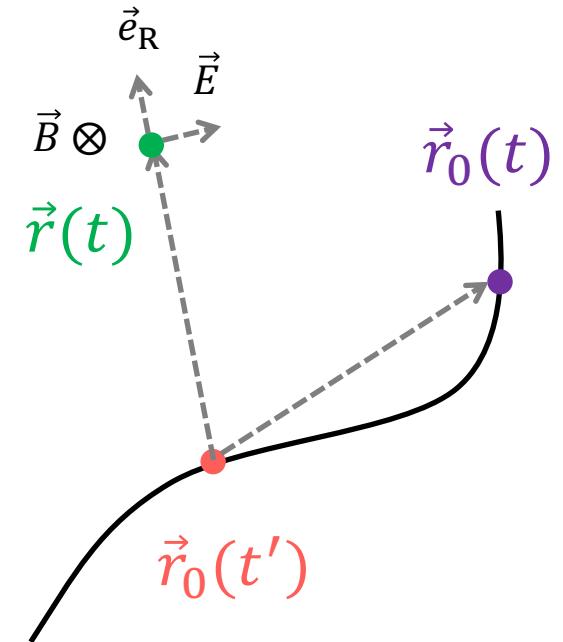

$$\vec{B}(r, t) = \vec{e}_R \times \vec{E}(r, t)$$

$$R = |\vec{r}(t) - \vec{r}_0(t')|, \vec{e}_R = \frac{\vec{R}}{R}$$

see Chpt. 3 of the REF book (p77 - 80)
by Rybicki & Lightman

$$\vec{\beta} = \frac{\vec{v}(t')}{c}, \beta = \frac{v(t')}{c}, v(t') = \dot{r}_0(t')$$

$$\kappa = 1 - \frac{\vec{e}_R \cdot \vec{v}(t')}{c} = 1 - \vec{e}_R \cdot \vec{\beta}$$

- $\vec{r}(t)$: field point
- $\vec{r}_0(t)$: current position of the moving charge
- $\vec{r}_0(t')$: retarded position of the moving charge
- t : observing time
- t' : retarded time

Retarded time

prev. sl.

Consider a moving point charge, its electric and magnetic fields are

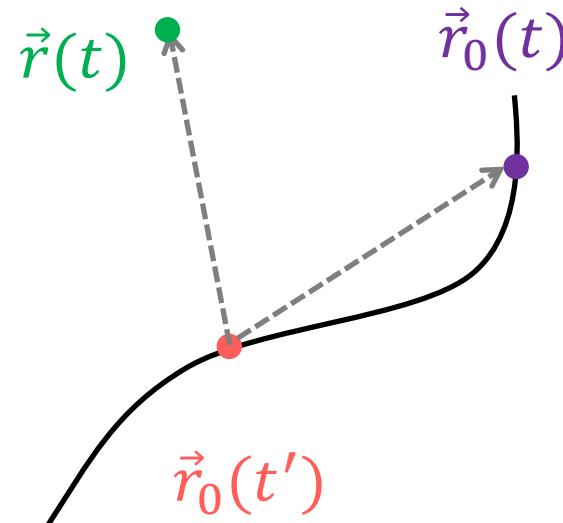

$$\vec{E}(r, t) = \dots$$

$$\vec{B}(r, t) = \vec{e}_R \times \vec{E}(r, t)$$

$$R = |\vec{r}(t) - \vec{r}_0(t')|, \vec{e}_R = \frac{\vec{R}}{R}$$

$$\vec{\beta} = \frac{\vec{v}(t')}{c}, \beta = \frac{v(t')}{c}, v(t') = \dot{r}_0(t')$$

$$\kappa = 1 - \frac{\vec{e}_R \cdot \vec{v}(t')}{c} = 1 - \vec{e}_R \cdot \vec{\beta}$$

$\vec{r}(t)$: field point
 $\vec{r}_0(t)$: current position of the moving charge
 $\vec{r}_0(t')$: retarded position of the moving charge
 t : observing time
 t' : retarded time

The propagation of electromagnetic waves has a finite speed. Accordingly, the radiation properties we observed at time t was emitted at an earlier time t'

$$t' = t - \frac{|\vec{r}(t) - \vec{r}_0(t')|}{c} = t - \frac{|\vec{r}_0(t) - \vec{r}_0(t')|}{c}$$

retarded time

Velocity field of an accelerated charge

prev. sl.

$$\vec{E}(r, t) = \frac{q}{\kappa^3 R^2} (\vec{e}_R - \vec{\beta})(1 - \beta^2) + \frac{q}{c\kappa^3 R} \vec{e}_R \times \left((\vec{e}_R - \vec{\beta}) \times \frac{\partial \vec{\beta}}{\partial t} \right)$$

$$\vec{e}_R = \frac{\vec{R}}{R}$$

$$\kappa = 1 - \frac{\vec{e}_R \cdot \vec{v}(t')}{c}$$

$$\beta = \frac{v(t')}{c}$$

$$\vec{E}_{\text{vel}} \propto \frac{1}{R^2}$$

$$\rightarrow \frac{q}{R^2} \vec{e}_R \text{ for } \beta \ll 1$$

velocity field \vec{E}_{vel}

For a constantly ($\partial \beta / \partial t = 0$) moving charge, $\vec{E} = \vec{E}_{\text{vel}}$

little contribution to radiation at large distance (R)

Coulomb's law

Radiation field of an accelerated charge

prev. sl.

$$\vec{E}(r, t) = \frac{q}{\kappa^3 R^2} (\vec{e}_R - \vec{\beta})(1 - \beta^2) + \frac{q}{c\kappa^3 R} \vec{e}_R \times \left((\vec{e}_R - \vec{\beta}) \times \frac{\partial \vec{\beta}}{\partial t} \right)$$

$$\vec{e}_R = \frac{\vec{R}}{R}$$
$$\kappa = 1 - \frac{\vec{e}_R \cdot \vec{v}(t')}{c}$$
$$\beta = \frac{v(t')}{c}$$

acceleration field \vec{E}_{acc}

$$\vec{B}_{\text{acc}} = \vec{e}_R \times \vec{E}_{\text{acc}}$$

radiation field
 \vec{E} refers to \vec{E}_{acc} hereafter

Only **accelerated** ($\partial\beta/\partial t \neq 0$) particles can give rise to radiation!

Acceleration can be caused by

- (1) external B-fields (e.g., cyclotron and synchrotron);
- (2a) collision with photons (e.g., Compton);
- (2b) collision among electrons (bremsstrahlung caused by Coulomb force)

Radiative power

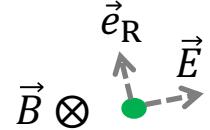

Poynting vector (radiative power vector per unit area)

prev. sl.

$$\vec{B}(r, t) = \vec{e}_R \times \vec{E}(r, t)$$

$$\vec{S} = \frac{c}{4\pi} \vec{E} \times \vec{B} = \frac{c}{4\pi} \vec{E} \times (\vec{e}_R \times \vec{E}) = \frac{c}{4\pi} \vec{e}_R |\vec{E}|^2$$

Sect. 1.3.1 of 《天体物理中的辐射机制》 by 尤峻汉 (p10)

$$\vec{a} \times (\vec{b} \times \vec{c}) = (\vec{a} \cdot \vec{c}) \vec{b} - (\vec{a} \cdot \vec{b}) \vec{c}$$

Along the direction of the Poynting vector \vec{e}_R , the radiative power received by an observer at the distance R with a collecting area $d\vec{A} = \vec{e}_R R^2 d\Omega$

$$dP(t) dt = \vec{S} \cdot d\vec{A} = \frac{c}{4\pi} |\vec{E}|^2 R^2 d\Omega$$

Radiative power received by an observer per unit solid angle

$$\frac{dP(t)}{d\Omega} = \frac{dE(t)}{dt d\Omega} = \frac{c}{4\pi} |\vec{E}|^2 R^2$$

Radiative power (cont.)

Conservation of energy: Energy received by an observer equals energy emitted by the emitter

prev. sl.

$$t' = t - \frac{|\vec{r}(t) - \vec{r}_0(t')|}{c} = t - \frac{|\vec{r}_0(t) - \vec{r}_0(t')|}{c}$$

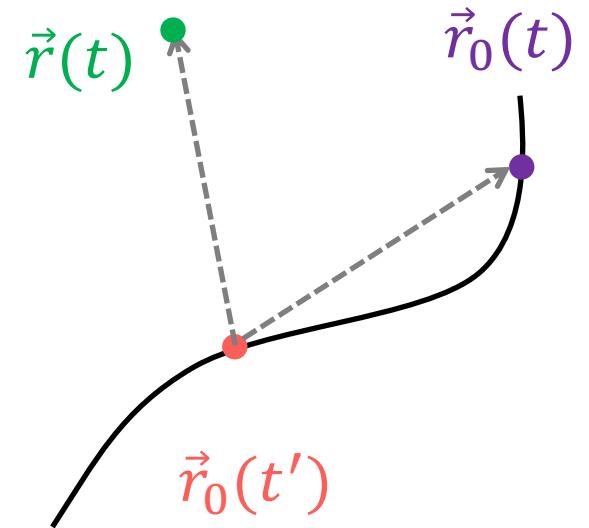

$$\kappa = 1 - \frac{\vec{e}_R \cdot \vec{v}(t')}{c} = 1 - \vec{e}_R \cdot \vec{\beta}$$

$$dP(t)dt = dP(t')dt'$$

$$\vec{R} = |\vec{r}(t) - \vec{r}_0(t')| \approx |\vec{r}(t)| - \vec{e}_R \cdot \vec{r}_0(t') \text{ for } |\vec{r}_0(t')| \ll |\vec{r}|$$

$$t' = t - \frac{|\vec{r}(t) - \vec{r}_0(t')|}{c} \approx t - \frac{1}{c} (|\vec{r}(t)| - \vec{e}_R \cdot \vec{r}_0(t'))$$

$$dt' = dt + \frac{1}{c} \vec{e}_R \cdot d\vec{r}_0(t')$$

$\vec{r}(t)$: field point

$\vec{r}_0(t)$: current position of the moving charge

$\vec{r}_0(t')$: retarded position of the moving charge

t : observing time

t' : retarded time

Radiative power angular distribution

prev. sl.

$$dt = dt' - \frac{1}{c} \vec{e}_R \cdot d\vec{r}_0(t')$$

$$\frac{dt}{dt'} = 1 - \frac{1}{c} \vec{e}_R \cdot \frac{d\vec{r}_0(t')}{dt'} = \kappa$$

$$\frac{dP(t')}{d\Omega} = \frac{dP(t)}{d\Omega} \frac{dt}{dt'} = \frac{dP(t)}{d\Omega} \kappa$$

$$\frac{dP(t')}{d\Omega} = \frac{q^2}{4\pi c \kappa^5} \left| \vec{e}_R \times \left((\vec{e}_R - \vec{\beta}) \times \dot{\vec{\beta}} \right) \right|^2$$

prev. sl.

$$v(t') = \dot{r}_0(t')$$

$$\kappa = 1 - \frac{\vec{e}_R \cdot \vec{v}(t')}{c} = 1 - \vec{e}_R \cdot \vec{\beta}$$

prev. sl.

$$dP(t)dt = dP(t')dt'$$

prev. sl.

$$\frac{dP(t)}{d\Omega} = \frac{dE(t)}{dt d\Omega} = \frac{c}{4\pi} |\vec{E}|^2 R^2$$

prev. sl.

$$\vec{E} = \frac{q}{c \kappa^3 R} \vec{e}_R \times \left((\vec{e}_R - \vec{\beta}) \times \dot{\vec{\beta}} \right)$$

Asymptotic behavior (non-relativistic)

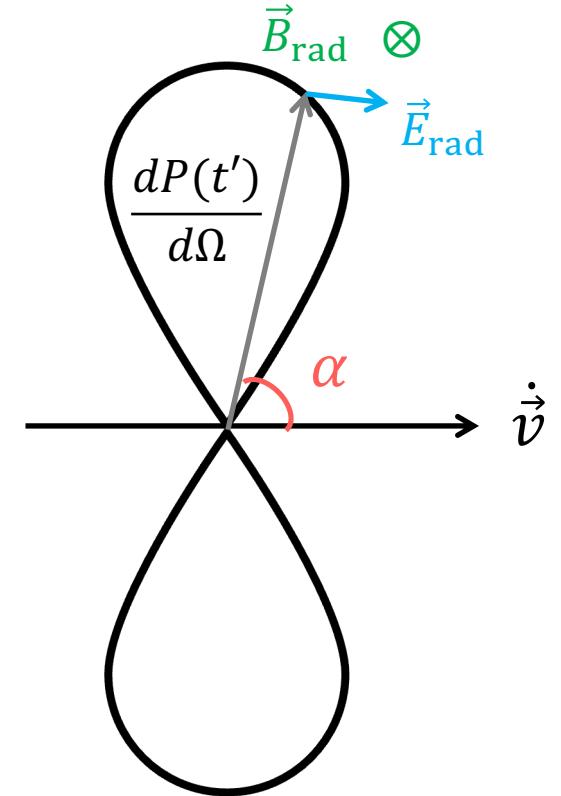

prev. sl.

$$\frac{dP(t')}{d\Omega} = \frac{q^2}{4\pi c \kappa^5} \left| \vec{e}_R \times \left((\vec{e}_R - \vec{\beta}) \times \dot{\vec{\beta}} \right) \right|^2$$

For non-relativistic particles with $v \ll c$ ($t \approx t'$), and α the angle between \vec{e}_R and $\dot{\vec{v}}$

$$\frac{dP}{d\Omega} = \frac{q^2}{4\pi c^3} \dot{v}^2 \sin^2 \alpha$$

$$\begin{aligned} \kappa &= 1 - \frac{\vec{e}_R \cdot \vec{v}}{c} \rightarrow 1 \\ \beta &= \frac{v}{c} \rightarrow 0 \\ \vec{e}_R \times (\vec{e}_R \times \dot{\vec{v}}) &= (\vec{e}_R \cdot \dot{\vec{v}}) \vec{e}_R - (\vec{e}_R \cdot \vec{e}_R) \dot{\vec{v}} = (\dot{v} \cos \alpha) \vec{e}_R - \dot{\vec{v}} \\ |\vec{e}_R \times \vec{e}_R \times \dot{\vec{v}}|^2 &= ((\dot{v} \cos \alpha) \vec{e}_R - \dot{\vec{v}})((\dot{v} \cos \alpha) \vec{e}_R - \dot{\vec{v}}) \\ &= (\dot{v} \cos \alpha)^2 (\vec{e}_R \cdot \vec{e}_R) - 2(\dot{v} \cos \alpha)(\dot{\vec{v}} \cdot \vec{e}_R) + \dot{v}^2 \\ &= \dot{v}^2 (\cos^2 \alpha - 2 \cos^2 \alpha + 1) = \dot{v}^2 \sin^2 \alpha \end{aligned}$$

Larmor's formula (non-relativistic)

prev. sl.

$$\frac{dP}{d\Omega} = \frac{q^2}{4\pi c^3} \dot{v}^2 \sin^2 \alpha$$

$$d\Omega = \int_0^{2\pi} d\phi \int_{-\pi/2}^{\pi/2} \sin \alpha \, d\alpha = 2\pi \int_{-1}^1 d \cos \alpha$$

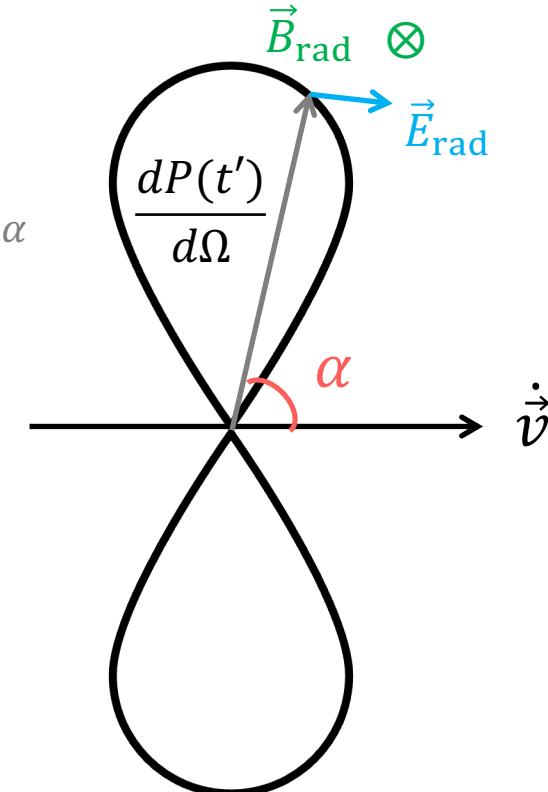

$$\int_{-1}^1 (1 - \cos^2 \theta) d \cos \theta = \frac{4}{3}$$

$$P = \frac{q^2}{4\pi c^3} \dot{v}^2 \int \sin^2 \alpha \, d\Omega = \frac{q^2}{2c^3} \dot{v}^2 \int_{-1}^1 (1 - \cos^2 \alpha) d \cos \alpha$$

$$P = \frac{2q^2 \dot{v}^2}{3c^3} = \frac{2 \ddot{d}^2}{3c^3}$$

$\ddot{d} = q \ddot{r} = q \dot{v}$

see Chpt. 3 of the REF book (p85 - 88) by Rybicki & Lightman for more discussions on the dipole approximation

- ✓ This dipole angular distribution is symmetrically perpendicular to the acceleration direction \vec{v}
- ✓ The maximum radiation is perpendicular to \vec{v} and there is no radiation along \vec{v}

Asymptotic behavior (relativistic)

For parallel acceleration,

see Chpt. 4 of Ribicki & Lightman
(p138-145)

$$\frac{dP_{\parallel}}{d\Omega} \approx \frac{16q^2 \dot{v}_{\parallel}^2}{\pi c^3} \gamma^{10} \frac{\gamma^2 \theta^2}{(1 + \gamma^2 \theta^2)^6}$$

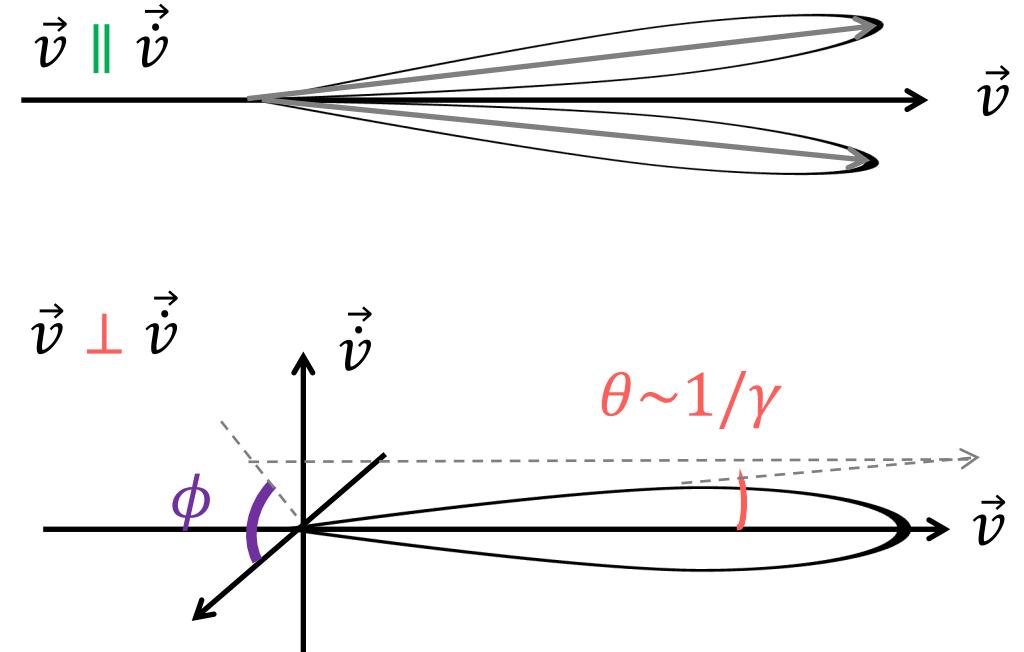

For perpendicular acceleration,

$$\frac{dP_{\perp}}{d\Omega} \approx \frac{4q^2 \dot{v}_{\perp}^2}{\pi c^3} \gamma^8 \frac{1 - 2\gamma^2 \theta^2 \cos 2\phi + \gamma^4 \theta^4}{(1 + \gamma^2 \theta^2)^6}$$

Lorentz factor

$$\gamma = \frac{mc^2}{m_0 c^2} = \frac{1}{\sqrt{1 - \beta^2}}$$

rest mass of the particle

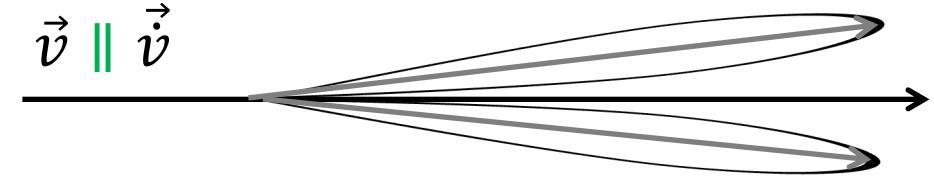

the larger the Lorentz factor,
the larger the radiative power

Parallel acceleration (relativistic)

prev. sl.

$$\frac{dP_{\parallel}}{d\Omega} \approx \frac{16q^2 \dot{v}_{\parallel}^2}{\pi c^3} \gamma^{10} \frac{\gamma^2 \theta^2}{(1 + \gamma^2 \theta^2)^6}$$

For $\theta = 0$

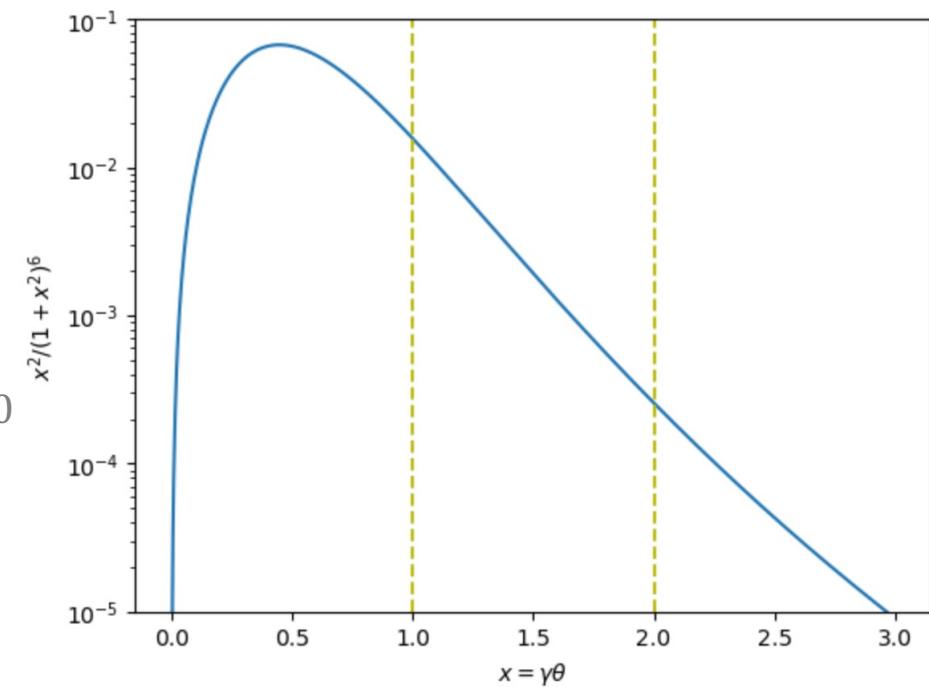

$$\frac{dP_{\parallel}}{d\Omega} = 0$$

For $\theta = 1/\gamma$

$$\frac{dP_{\parallel}}{d\Omega} \approx \frac{16q^2 \dot{v}_{\parallel}^2}{\pi c^3} \gamma^{10} \frac{1}{2^6} \frac{1/2^6}{2^2/(1+2^2)^6} \sim 60$$

For $\theta = 2/\gamma$

$$\frac{dP_{\parallel}}{d\Omega} \approx \frac{16q^2 \dot{v}_{\parallel}^2}{\pi c^3} \gamma^{10} \frac{2^2}{(1+2^2)^6}$$

Perpendicular acceleration (relativistic)

prev. sl.

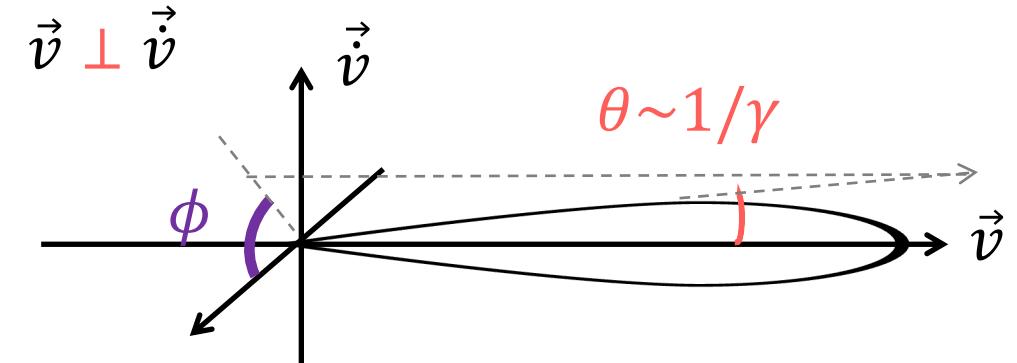

$$\frac{dP_{\perp}}{d\Omega} \approx \frac{4q^2 \dot{v}_{\perp}^2}{\pi c^3} \gamma^8 \frac{1 - 2\gamma^2\theta^2 \cos 2\phi + \gamma^4\theta^4}{(1 + \gamma^2\theta^2)^6}$$

For $\theta = 0$

$$\frac{dP_{\perp}}{d\Omega} \approx \frac{4q^2 \dot{v}_{\perp}^2}{\pi c^3} \gamma^8$$

For $\theta = 1/\gamma$

$$\frac{dP_{\perp}}{d\Omega} \approx \frac{4q^2 \dot{v}_{\perp}^2}{\pi c^3} \gamma^8 \frac{(1 - \cos^2 2\phi)}{2^5}$$

The radiation is smaller by a factor of $\sim 2^5 = 32$ at the half opening angle of $\phi = \gamma^{-1}$
The **larger** the Lorentz factor, the **smaller** the opening angle

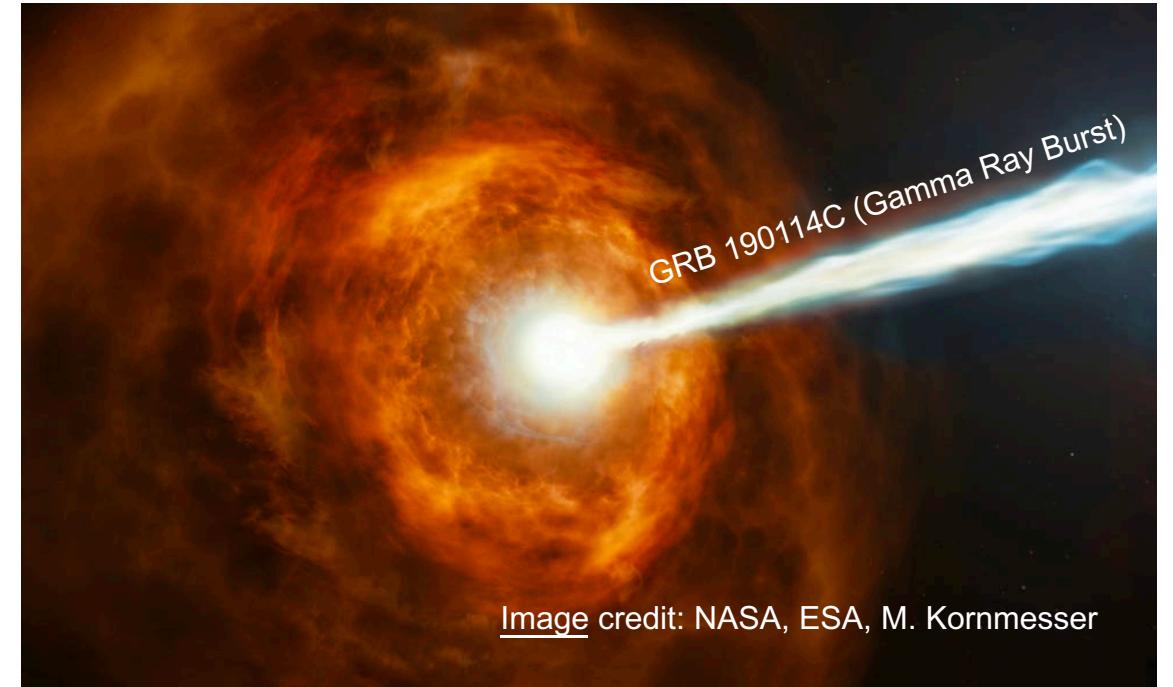

Gamma-Ray bursts (GRBs)

GRBs are the most luminous explosions in the Universe ([Meszaros 2006](#)) with a typical energy of 10^{51} erg s $^{-1}$ ([Frail et al. 2001](#)).

cf. $L(\text{FRB}) \sim 10 L_{\odot} \sim 10 \times 3.8 \times 10^{33}$ erg s $^{-1}$

GRBs are discovered serendipitously in the 1967 by Vela satellites ([Klebesadel et al. 1973](#))

The Lorentz factor of GRBs can be $\gtrsim 10^2$ ([Lithwick & Sari 2001](#), [Ghirlanda et al. 2018](#))

[Image credit: NASA, ESA, M. Kornmesser](#)

Total radiative power (relativistic)

the radiative power is significantly larger ($\propto \gamma^n$) than the non-relativistic one

$$P = \frac{2q^2}{3c^3} \gamma^4 (\dot{v}_\perp^2 + \gamma^2 \dot{v}_\parallel^2)$$

Chpt. 4 of the REF book (p137-140) by Ribicki & Lightman

Larmor's formula

$$P = \frac{2q^2 \dot{v}^2}{3c^3} = \frac{2 \ddot{d}^2}{3c^3}$$

When $\beta \rightarrow 0$ ($\gamma \rightarrow 1$), the radiative power is identical to that of the Larmor's formula

$$\dot{v} \propto \frac{1}{m_0}$$

The **smaller** the particle mass, the **larger** the radiative power
→ Radiation of **electrons** are much larger than that of protons

Pulsar

Note that clear signals from PSR B0329+54 were present in the 1954 survey data of Jodrell Bank 250-foot radio telescope ([Lyne & Graham-Smith 2006](#)) and X-ray pulses from the Crab Nebula were "observed" in June 1967 but not "analyzed" ([Fishman et al. 1969](#))

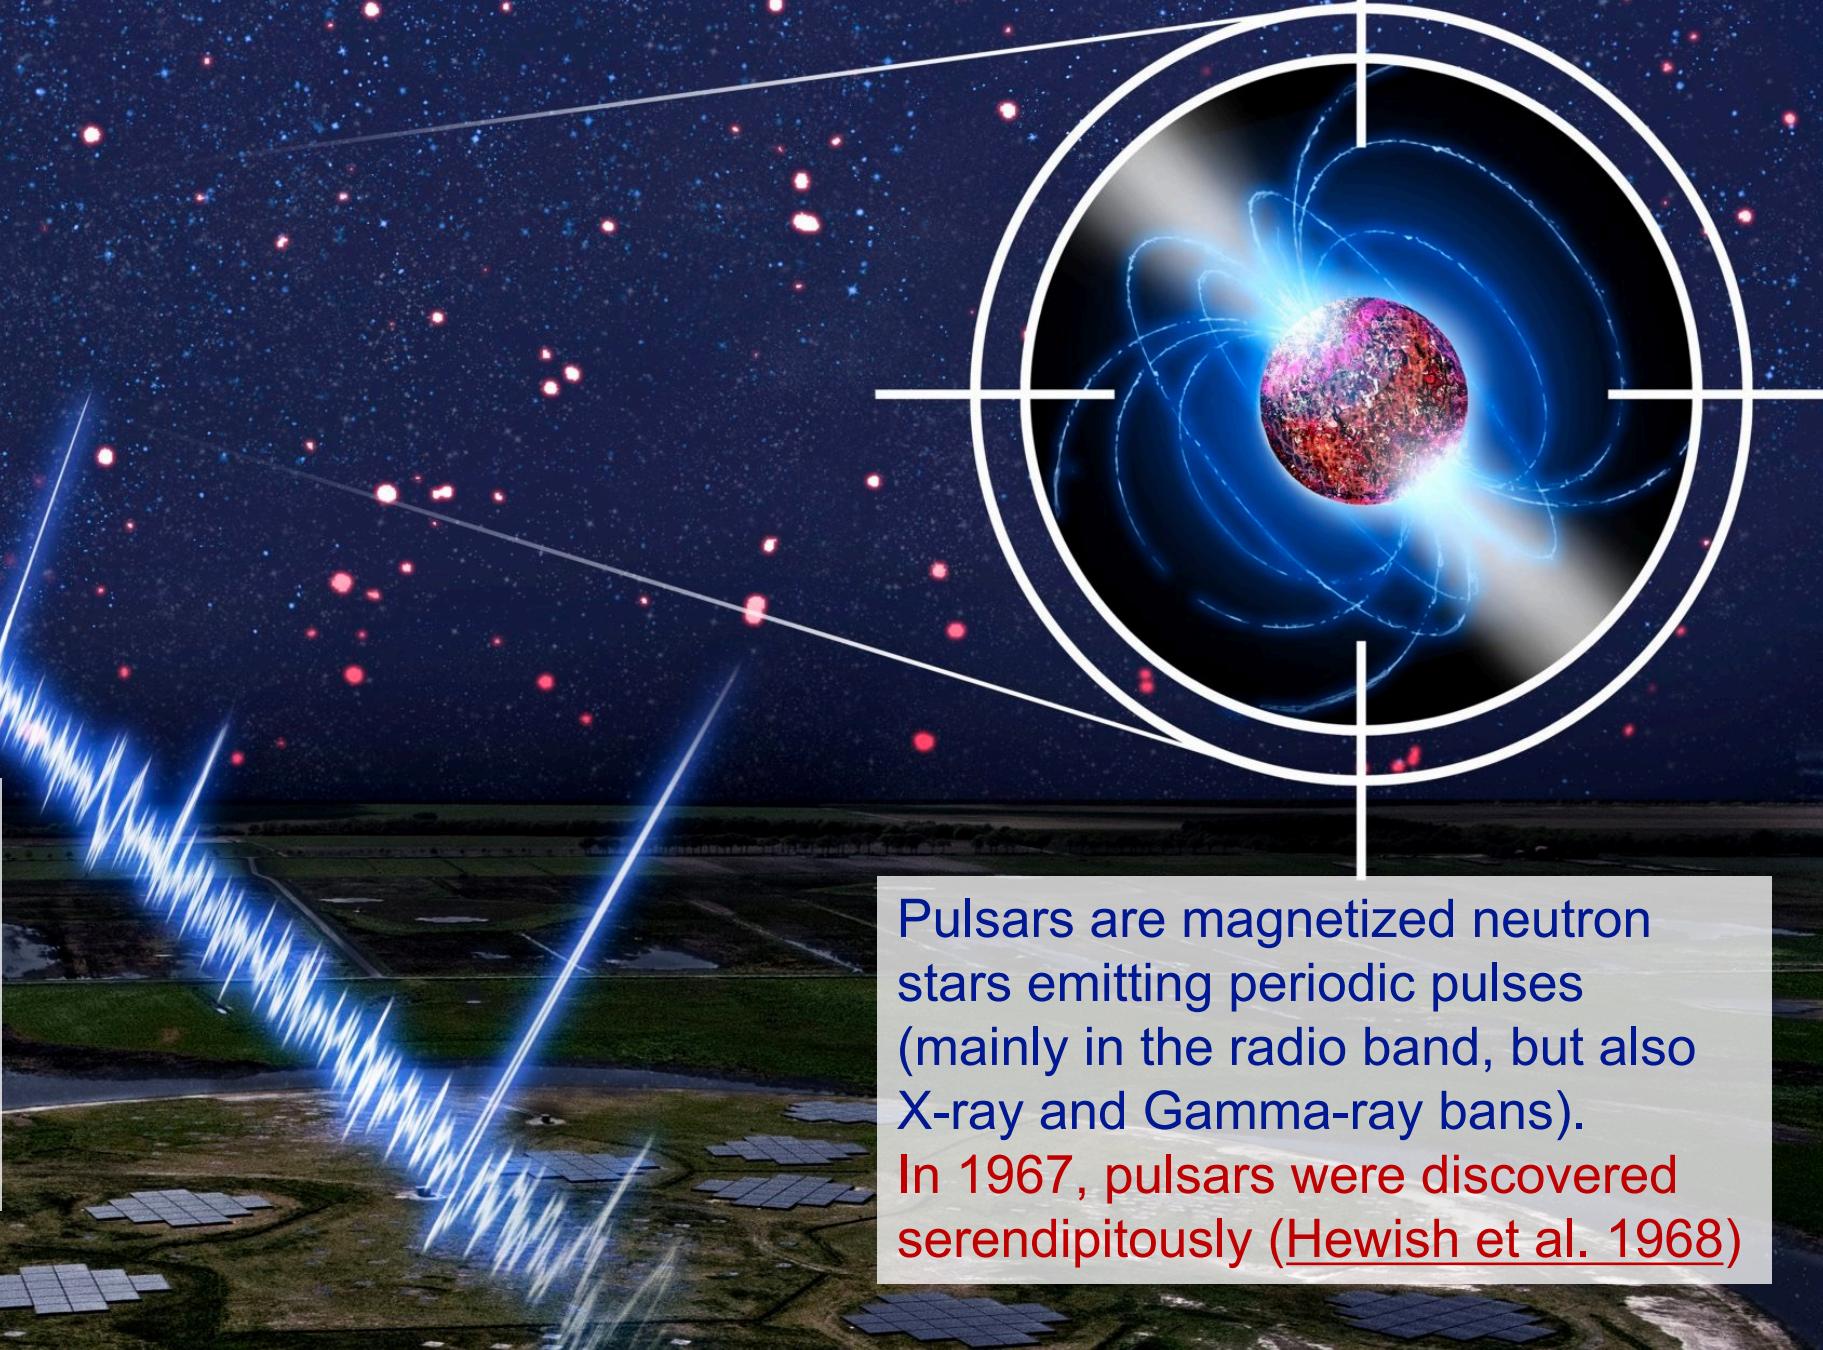

Image credit: Danielle Futselaar and ASTRON

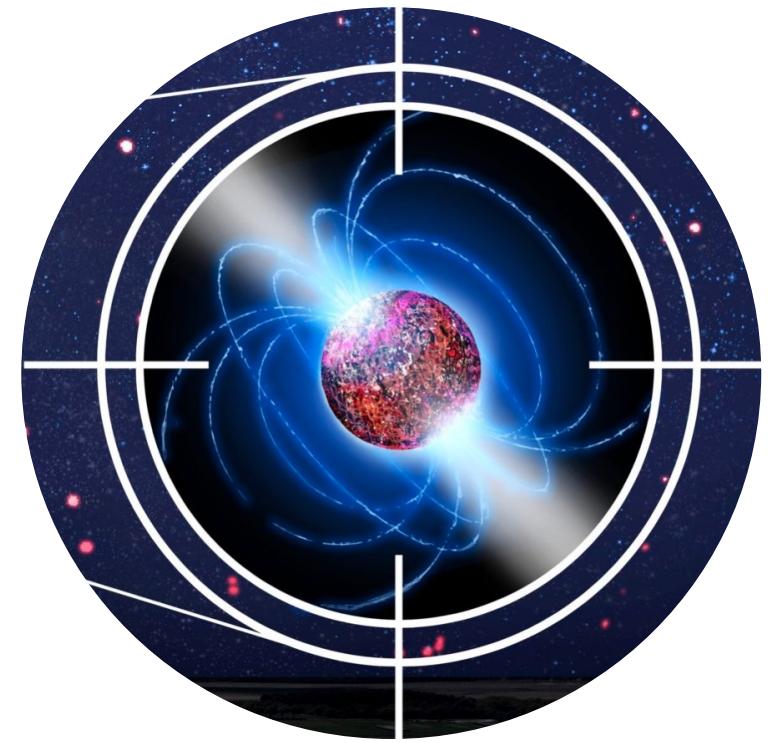

3.1.5.1 Pulsar

Pulsars are magnetized neutron stars emitting periodic pulses (mainly in the radio band, but also X-ray and Gamma-ray bands). In 1967, pulsars were discovered serendipitously ([Hewish et al. 1968](#))

Neutron star (NS)

The concept of neutron stars was envisioned with **trepidation** by Baade & Zwicky (1934): “With all reserve we advance the view that a supernova represents the transition of an ordinary star into a new form of star, the neutron star, which would be the endpoint of stellar evolution. Such a star may possess a very small radius and an extremely high density.”

A feeling of fear or anxiety about something that may happen

PSR J0250+5854

$$P_{\text{spin}} = 23.5 \text{ s}$$

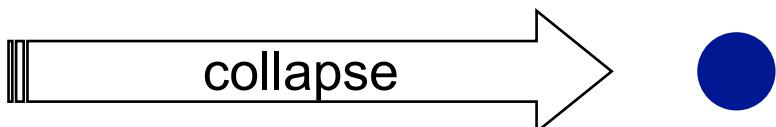

Tan et al. 2018

Normal star

$$\begin{aligned} B &\sim 1 \text{ G} \\ R &\sim 10^6 \text{ km} \\ P_{\text{spin}} &\sim 1 \text{ yr} \end{aligned}$$

Conservation of angular momentum

$$L \propto m r^2 \omega$$

Neutron star

$$R \sim 10 \text{ km}$$

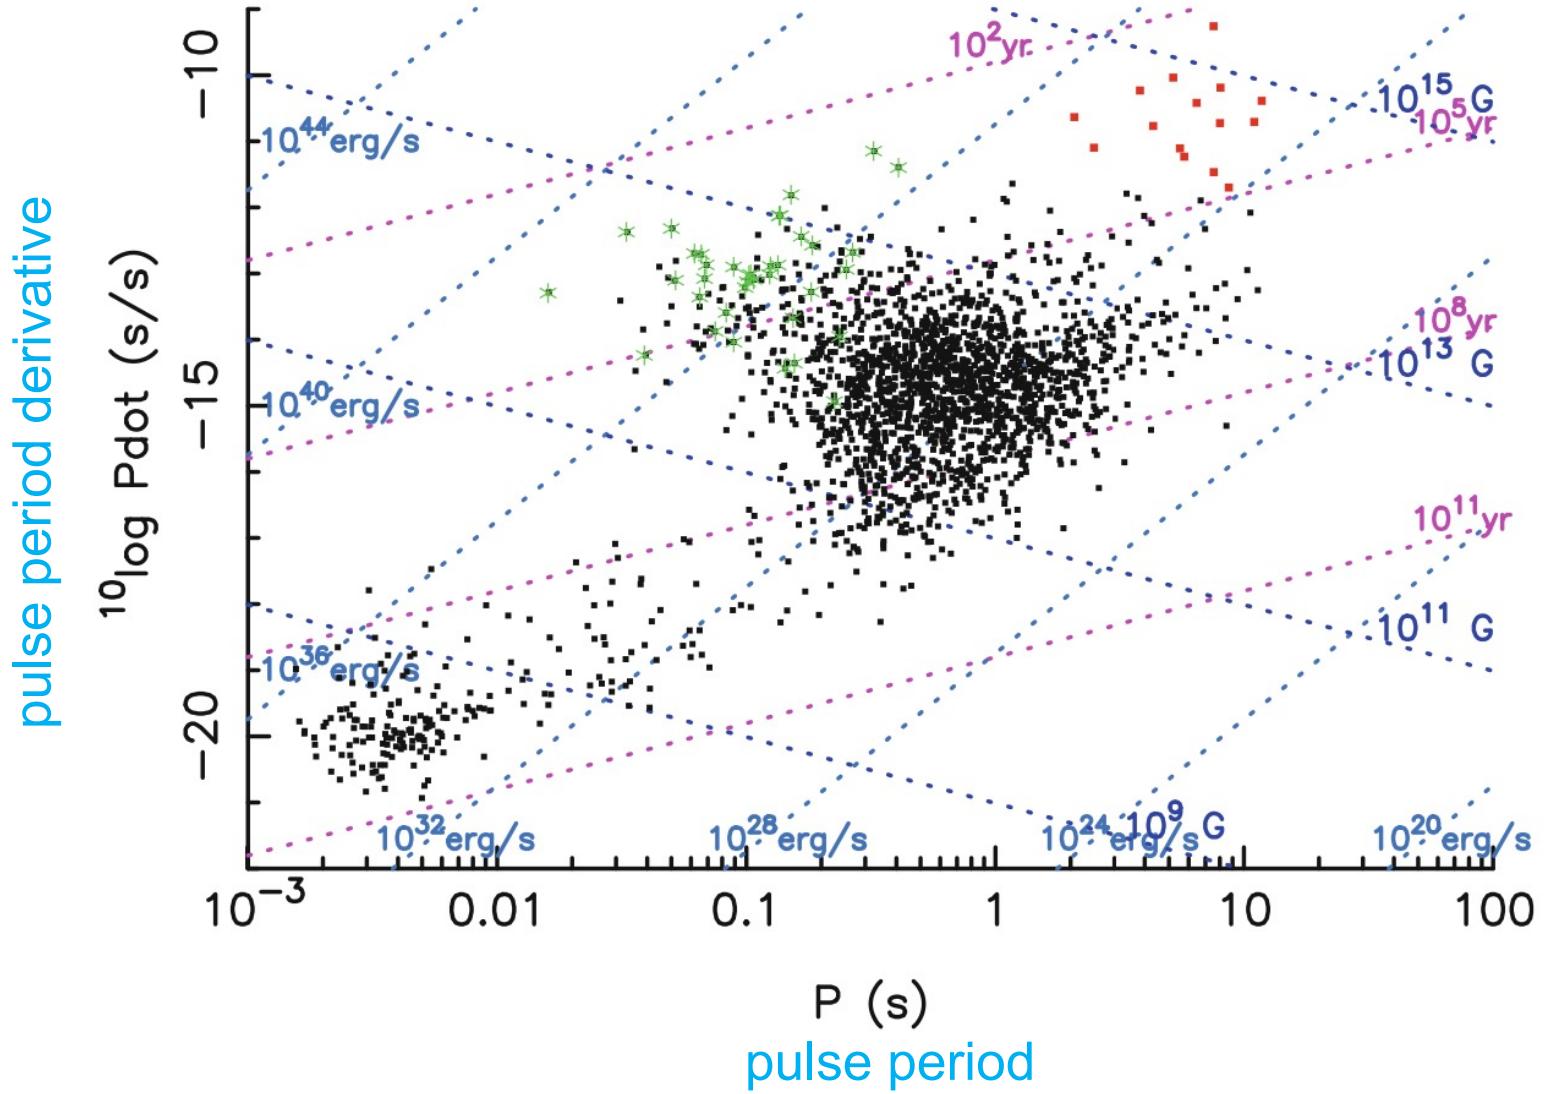

$$\begin{aligned} B &\sim 10^{10} \text{ G} \\ P_{\text{spin}} &\sim 10^{-3} \text{ s} \end{aligned}$$

Conservation of magnetic flux

$$\Phi = \int \vec{B} \cdot \vec{e}_A dA$$

Why is PSR
J0250+5854 so slow?

P-Pdot diagram for pulsars

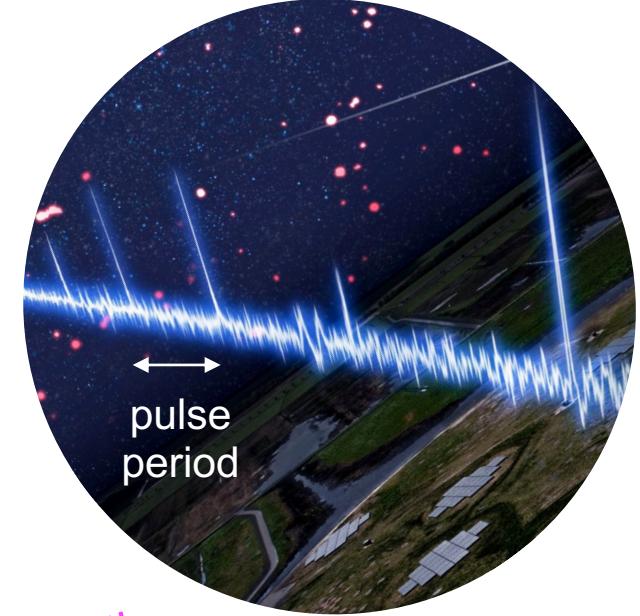

characteristic
pulsar age

surface B-field
strength

red squares: magnetars
green stars: pulsars in
pulsar wind nebulae

Vink (2021)

Magnetic dipole

A young neutron star can be viewed as a rapidly rotating dipole

The power of magnetic dipole rotation is similar to that of electric dipole

$$P = \frac{2(\ddot{\mu} \sin \alpha)^2}{3c^3}$$

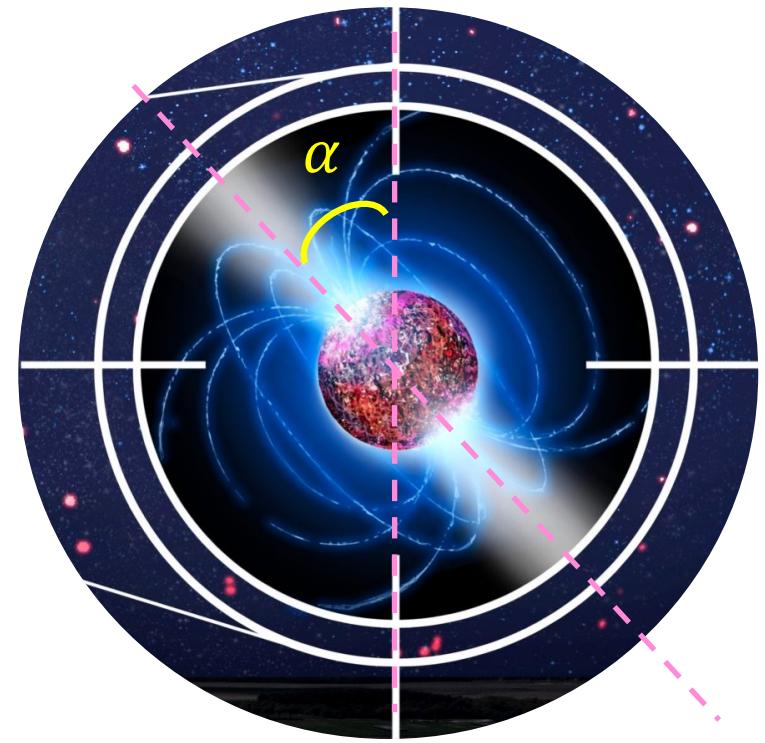

$$= \frac{2\mu^2 \omega^4}{3c^3} \sin^2 \alpha$$

magnetic dipole momentum $\rightarrow \mu = \frac{1}{2}BR_{NS}^3$

$$\frac{d\vec{\mu}}{dt} = \vec{\omega} \times \vec{\mu}$$
$$\ddot{\mu} = \mu \omega^2$$

$$\omega = \frac{2\pi}{P}$$

↑
pulse period

Why are some pulsars so slow?

Larmor's formula

$$P = \frac{2q^2 \dot{v}^2}{3c^3} = \frac{2\ddot{d}^2}{3c^3}$$

Pulsar spin down and B-field strength

Assuming the spin-down of pulsars is due to the energy and momentum loss of the magnetic dipole radiation,

$$\frac{d}{dt} \left(-\frac{1}{2} I \omega^2 \right) = \frac{2 \mu^2 \omega^4}{3 c^3} \sin^2 \alpha$$

Lattimer & Schutz, 2005

$$\mu = \frac{1}{2} B R_{\text{NS}}^3$$

$$\omega = \frac{2\pi}{P}$$

$$I \simeq \frac{1}{5} M_{\text{NS}} R_{\text{NS}}^2$$

$$\frac{d}{dt} \left(-\frac{1}{2} I \omega^2 \right) = \frac{4\pi^2 M_{\text{NS}} R_{\text{NS}}^2}{2 \times 5} \frac{2 \dot{P}}{P^3}$$

$$\frac{2 \mu^2 \omega^4}{3 c^3} \sin^2 \alpha = \frac{1}{6} \frac{B^2 R_{\text{NS}}^6}{c^3} \frac{(4\pi^2)^2}{P^4} \sin^2 \alpha$$

$$B = \left(\frac{3c^3}{10\pi^2 \sin^2 \alpha} P \dot{P} \frac{M_{\text{NS}}}{R_{\text{NS}}^4} \right)^{1/2} = \frac{2.4 \times 10^{19}}{\sin \alpha} \left(P \dot{P} \right)^{\frac{1}{2}} \left(\frac{M_{\text{NS}}}{1.4 M_{\odot}} \right)^{\frac{1}{2}} \left(\frac{10 \text{ km}}{R_{\text{NS}}} \right)^2 \text{ G}$$

Scattered power and angular distribution

Consider the response of a free electron to a **linearly polarized** incident EM wave, the time-averaged acceleration is

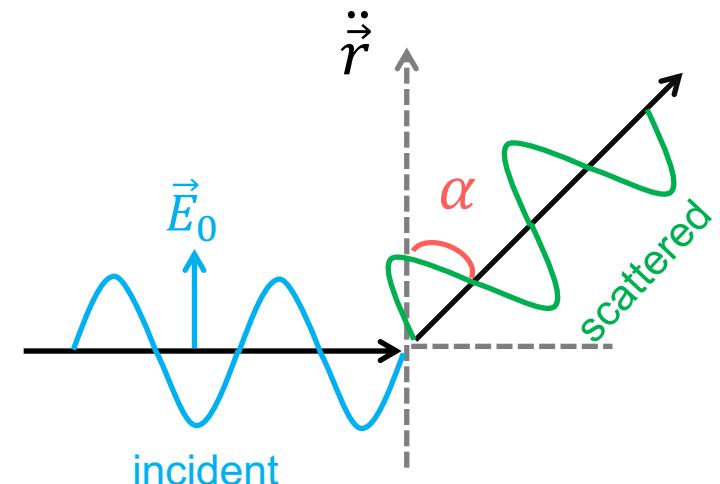

$$\langle \dot{r}^2 \rangle = \frac{1}{2} \left(\frac{eE}{m_e} \right)^2 \quad \text{see Chpt. 3 of the REF book (p90-91) by Rybicki \& Lightman}$$

see Chpt. 3 of the REF book
(p90-91) by Rybicki & Lightman

$$\left\langle \frac{dP}{d\Omega} \right\rangle = \frac{e^2}{4\pi c^3} \langle \ddot{r}^2 \rangle \sin^2 \alpha = \frac{e^4 E^2}{8\pi m_e^2 c^3} \sin^2 \alpha$$

$$\langle P \rangle = \int \left\langle \frac{dP}{d\Omega} \right\rangle d\Omega = \frac{e^4 E^2}{8\pi m_e^2 c^3} \int_0^{2\pi} d\phi \int_{-1}^1 (1 - \cos^2 \alpha) d\cos \alpha = \frac{e^4 E^2}{3 m_e^2 c^3}$$

$$\int_{-1}^1 (1 - \cos^2 \theta) d \cos \theta = \frac{4}{3}$$

prev. sl.

$$\frac{dP}{d\Omega} = \frac{q^2}{4\pi c^3} \dot{v}^2 \sin^2 \alpha$$

Differential cross section

The time-averaged incident flux is

$$\langle S \rangle = \frac{cE^2}{8\pi} \quad \text{see Chpt. 3 of the REF book (p90) by Rybicki & Lightman}$$

prev. sl.

$$\left\langle \frac{dP}{d\Omega} \right\rangle = \frac{e^2}{4\pi c^3} \langle \ddot{r}^2 \rangle \sin^2 \alpha = \frac{e^4 E^2}{8\pi m_e^2 c^3} \sin^2 \alpha$$

The angular distribution of scattered power relates to the time-averaged incident flux and the differential cross section ($d\sigma$) for scattering into solid angle $d\Omega$ as

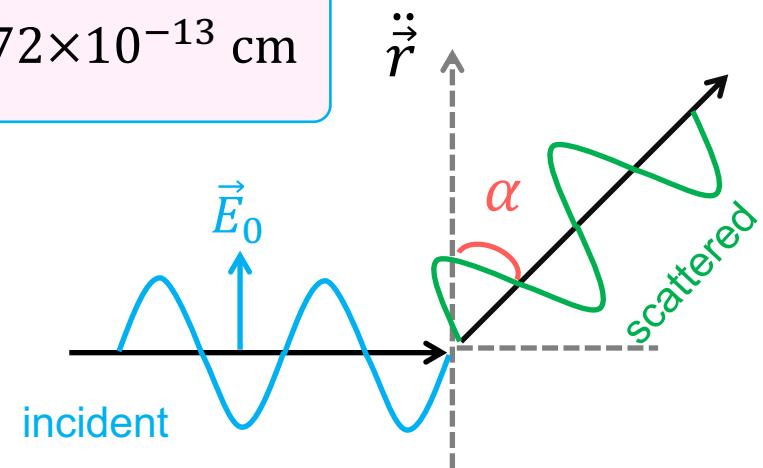

$$\left\langle \frac{dP}{d\Omega} \right\rangle = \langle S \rangle \frac{d\sigma}{d\Omega} = \frac{cE^2}{8\pi} \frac{d\sigma}{d\Omega}$$

classical electron radius

$$r_0 = \frac{e^2}{m_e c^2} = 2.72 \times 10^{-13} \text{ cm}$$

$$\frac{d\sigma}{d\Omega} = \frac{e^4}{m_e^2 c^4} \sin^2 \alpha = r_0^2 \sin^2 \alpha$$

The scattered radiation is linearly polarized

Total cross section

prev. sl.

$$\frac{d\sigma}{d\Omega} = \frac{e^4}{m_e^2 c^4} \sin^2 \alpha = r_0^2 \sin^2 \alpha$$

$$r_0 = \frac{e^2}{m_e c^2} = 2.72 \times 10^{-13} \text{ cm}$$

$$\sigma = \int \frac{d\sigma}{d\Omega} d\Omega = r_0^2 \int_0^{2\pi} d\phi \int_{-1}^1 (1 - \cos^2 \alpha) d \cos \alpha$$

$$\int_{-1}^1 (1 - \cos^2 \theta) d \cos \theta = \frac{4}{3}$$

Thomson scattering cross section

$$\sigma_T = \frac{8\pi r_0^2}{3} = 6.652 \times 10^{-25} \text{ cm}^2$$

Alternative approach to get the total cross section

prev. sl.

$$\langle P \rangle = \frac{e^4 E^2}{3 m_e^2 c^3}$$

prev. sl.

$$\langle S \rangle = \frac{c E^2}{8\pi}$$

$$\sigma = \frac{\langle P \rangle}{\langle S \rangle}$$

Differential cross section of unpolarized radiation

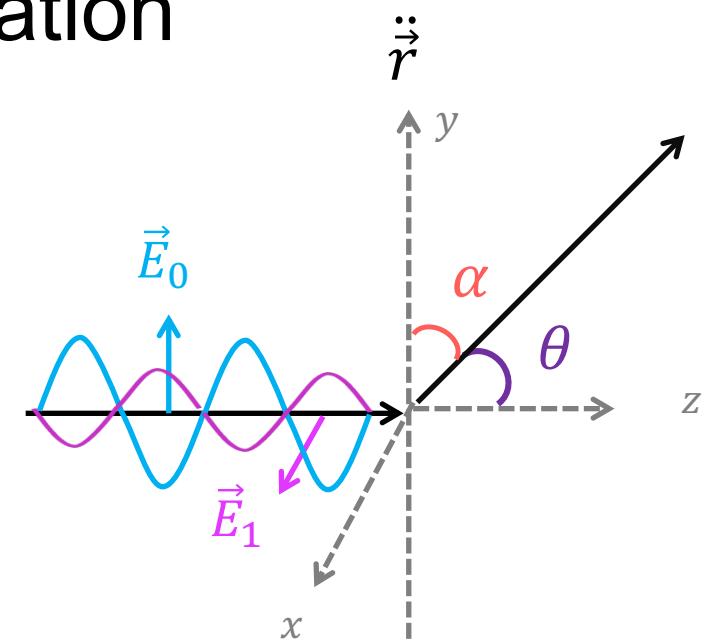

Thomson scattering of **unpolarized** radiation can be obtained by decomposing the radiation into a pair of two orthogonally **linear-polarized** radiations ($\vec{E}_0 \perp \vec{E}_1$), the differential cross section of **unpolarized** radiation

$$\left(\frac{d\sigma}{d\Omega}\right)_{\text{unpol}} = \frac{1}{2} \left(\frac{d\sigma}{d\Omega}(\pi/2) \right)_{\text{pol}} + \frac{1}{2} \left(\frac{d\sigma}{d\Omega}(\alpha) \right)_{\text{pol}}$$

$$= \frac{1}{2} r_0^2 (1 + \sin^2 \alpha)$$

$$= \frac{1}{2} r_0^2 (1 + \cos^2 \theta)$$

scattering angle $\theta = \pi/2 - \alpha$

prev. sl.

$$\frac{d\sigma}{d\Omega} = \frac{e^4}{m_e^2 c^4} \sin^2 \alpha = r_0^2 \sin^2 \alpha$$

The differential cross section is symmetric for $\pm\theta$

Total cross section of unpolarized radiation

prev. sl.

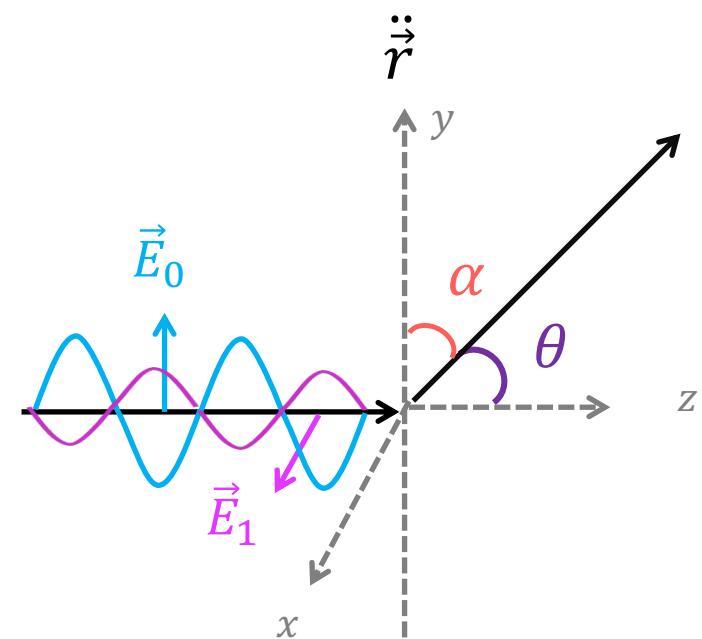

$$\left(\frac{d\sigma}{d\Omega}\right)_{\text{unpol}} = \frac{1}{2} r_0^2 (1 + \cos^2 \theta)$$

$$\sigma_{\text{unpol}} = \int \left(\frac{d\sigma}{d\Omega}\right)_{\text{unpol}} d\Omega$$

$$\int_{-1}^1 (1 + \cos^2 \theta) d\cos \theta = \frac{8}{3}$$

$$= \frac{r_0^2}{2} \int_0^{2\pi} d\phi \int_{-1}^1 (1 + \cos^2 \theta) d\cos \theta$$

$$= \frac{8}{3} \pi r_0^2$$

Thomson scattering cross section

$$\sigma_T = \frac{8\pi r_0^2}{3} = 6.652 \times 10^{-25} \text{ cm}^2$$

While the differential cross sections differ for **polarized** and **unpolarized** radiations, the total cross section is identical.

- ✓ Only valid for $h\nu \ll m_e c^2$ (i.e. $\ll 511 \text{ keV}$). Below this threshold, the (differential and total) Thomson scattering cross section is **independent** of the incident photon energy.

Gravity vs Radiation

Consider a test particle with mass m at the distance r with respect to a black hole with mass M_{BH} and luminosity L

Gravitational force

$$f_{\text{grav}} = \frac{G M_{\text{BH}} m}{r^2}$$

Radiation pressure

$$p_{\text{rad}} = \frac{1}{c} \frac{L}{4\pi r^2}$$

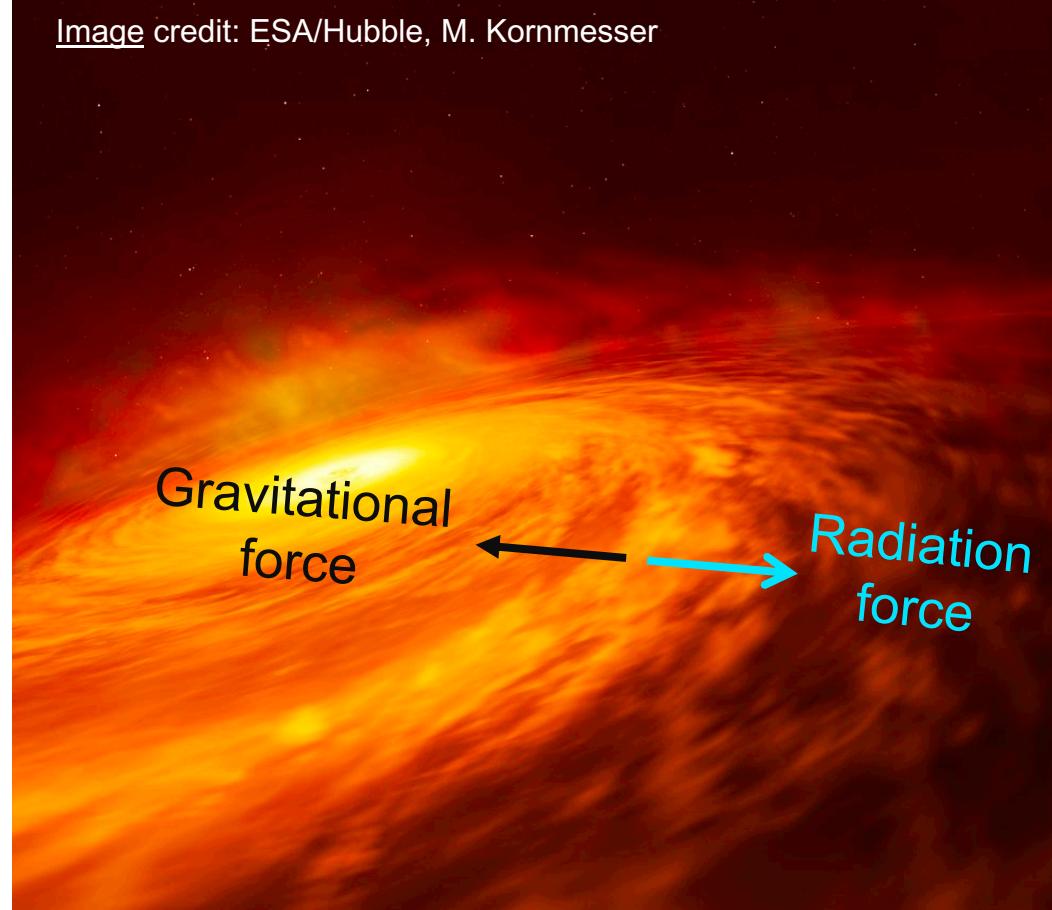

Radiation force

$$f_{\text{rad}} = p_{\text{rad}} \kappa m = \frac{\kappa m}{c} \frac{L}{4\pi r^2}$$

Helical motion of non-relativistic electrons

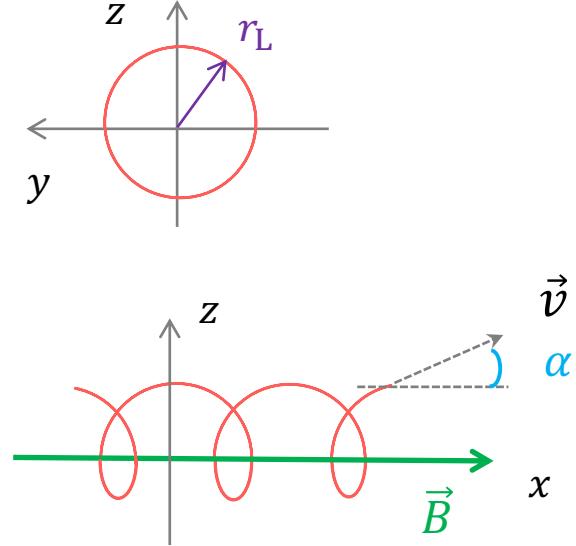

For non-relativistic electrons, when moving in a homogenous B -field with α the angle between v and B , they will spiral along the field line.

The projected motion in the (y, z) plane is a circle with

$$r_L = \frac{v \sin \alpha}{\omega_L}$$

Larmor frequency

$$\omega_L = \frac{eB}{m_e c}$$

- If non-relativistic electrons do not move along the field line ($v \sin \alpha = 0$), the radiation has only one frequency (ω_L).
- Otherwise, harmonic frequencies $2\omega_L, 3\omega_L, \dots$ can also be observed.
- The radiative power of cyclotron radiation declines rapidly for higher-order harmonic frequencies

Sect. 4.1.3 of 《天体物理中的辐射机制》 by 尤峻汉 (p161)

$$\frac{P_{n+1}}{P_n} \sim \beta^2, n = 1, 2, 3, \dots$$

Radiative power of cyclotron radiation

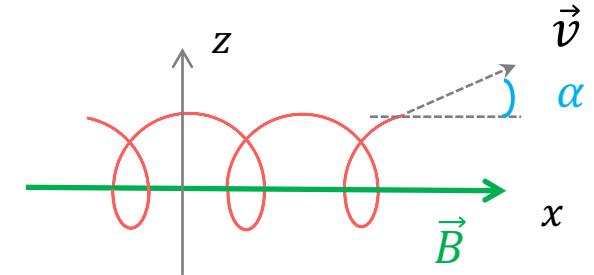

For non-relativistic electrons, the radiative power (consider only the base frequency radiation) simply follows Larmor's formula

Larmor's formula

$$P = \frac{2e^2 \dot{v}^2}{3c^3}$$

Often is the case that we want to know the radiative power given the B -field strength and the velocity of electrons

$$\begin{aligned} P(\alpha) &= \frac{2}{3} \frac{e^4}{m_e^2 c^5} v^2 B^2 \sin^2 \alpha = \frac{2}{3} c r_0^2 \beta^2 B^2 \sin^2 \alpha \\ &= 1.59 \times 10^{-15} \beta^2 \left(\frac{B}{G}\right)^2 \sin^2 \alpha \text{ erg s}^{-1} \end{aligned}$$

Sect. 4.1.2 of 《天体物理中的辐射机制》 by 尤峻汉 (p156)

$$m_e \dot{v} = -\frac{e}{c} v B \sin \alpha$$

classical electron radius

$$r_0 = \frac{e^2}{m_e c^2} = 2.72 \times 10^{-13} \text{ cm}$$

Mean radiative power of cyclotron radiation

prev. sl.

$$P(\alpha) = \frac{2}{3} c r_0^2 \beta^2 B^2 \sin^2 \alpha$$

If the velocity distribution of the electrons is isotropic, we have

$$\int_0^\pi \sin^3 \alpha \ d\alpha = \frac{4}{3}$$

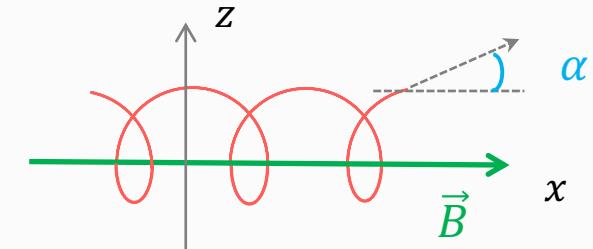

$$\langle \sin^2 \alpha \rangle = \frac{\int \sin^2 \alpha \ d\Omega}{\int d\Omega} = \frac{1}{4\pi} \int_0^{2\pi} d\phi \int_0^\pi \sin^3 \alpha \ d\alpha = \frac{2}{3}$$

$$\langle P \rangle = \frac{4}{9} c r_0^2 \beta^2 B^2 = 1.06 \times 10^{-15} \beta^2 \left(\frac{B}{G}\right)^2 \text{ erg s}^{-1}$$

Angular distribution of cyclotron radiation

The angular distribution of cyclotron radiation (again, referring to the base frequency radiation) received by a distant observer is

$$\frac{dP_1}{d\Omega} \sim \frac{\pi e^2 v_L^2 \beta^2}{2c} (1 + \cos^2 \alpha)$$

- Along the direction of the B -field ($\alpha = 0$), the radiative power reaches its maximum.
 - ❖ cyclotron radiation is **circularly** polarized
- Perpendicular to the B -field ($\alpha = \pi/2$), the radiative power reaches its **minimum**, yet only smaller by a factor of 2 compared to the **maximum** value.
 - ❖ cyclotron radiation is **linearly** polarized
- At other **directions**, radiative power has **intermediate values**
 - ❖ cyclotron radiation is **elliptically** polarized

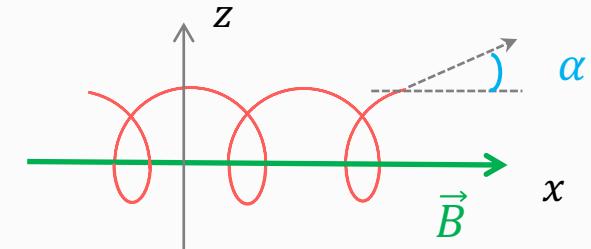

see Sect. 4.1.4 of 《天体物理中的辐射机制》 by 尤峻汉(p164-165)

Polarization of cyclotron radiation

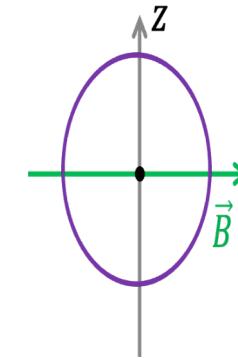

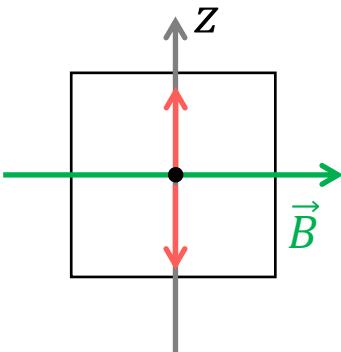

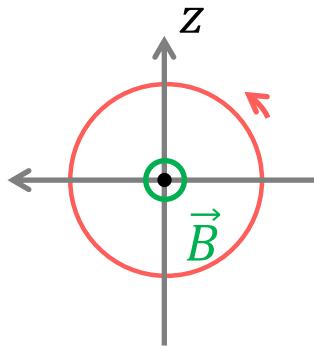

The polarization of cyclotron radiation (again, referring to the base-frequency radiation) is

$$\vec{E}_1 = \left(-\frac{1}{2\nu_0} \beta \cos^2 \alpha \right) \vec{x} + \left(-\frac{-i\beta}{2\nu_0} \right) \vec{y} + \left(\frac{\beta}{2\nu_0} \cos \alpha \sin \alpha \right) \vec{z}$$

see Sect. 4.1.4 of 《天体物理中的辐射机制》 by 尤峻汉(p164-165)

- Along the direction of the B -field ($\alpha = 0$), cyclotron radiation is **circularly** polarized
- Perpendicular to the B -field ($\alpha = \pi/2$), cyclotron radiation is **linearly** polarized
- At other directions, cyclotron radiation is **elliptically** polarized

3.5.7 Lifetime of synchrotron radiation

3.5.8 Curvature radiation

Helical motion of synchrotron radiation

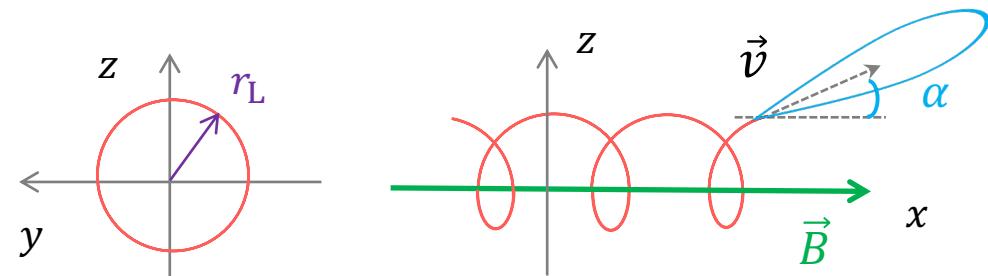

The base frequency of synchrotron radiation is a factor of γ (Lorentz factor) **lower** than Larmor's frequency

$$\omega_0 = \frac{1}{\gamma} \omega_L$$

Sect. 6.1 of the REF book (p167-168) by Rybicki & Lightman

Larmor frequency

$$\omega_L = \frac{eB}{m_e c}$$

The reduced base frequency leads to a **large** radius of the helical motion ($r \sim c/\nu_0$)

- Considering a relativistic electron with $\gamma = 100$ travelling in a normal spiral galaxy with a typical interstellar B -field strength of $10 \mu\text{G}$ ([Condon & Ransom 2016](#)), we have $\nu_L \sim 30 \text{ Hz}$ and $\nu_0 = \frac{\nu_L}{\gamma} \sim 0.3 \text{ Hz}$. The radius of the helical motion is of the order of 10^{11} cm .
- Almost **linear** at small scales ($r \ll c/\nu_0$).
- Harmonic frequencies $2\nu_0, 3\nu_0, \dots$ can also be observed.
- The base and harmonic frequencies are much **closer** to each other in the frequency domain

Time duration of synchrotron radiation

- The radiation is **strongly beamed** with the half-angle of the radiation cone equals $1/\gamma$.
- We only see a **short** pulse of radiation in each orbit when the beam is **pointing towards us**.
- The time duration (Δt) of the radiation emitted between P_1 and P_2 is

$$\gamma m_e \frac{\Delta\nu}{\Delta t} = \frac{e}{c} \nu B \sin \alpha$$

$$\frac{\Delta\theta}{2} = \frac{1}{\gamma}$$

$$\Delta\nu = \nu \Delta\theta = \frac{2\nu}{\gamma}$$

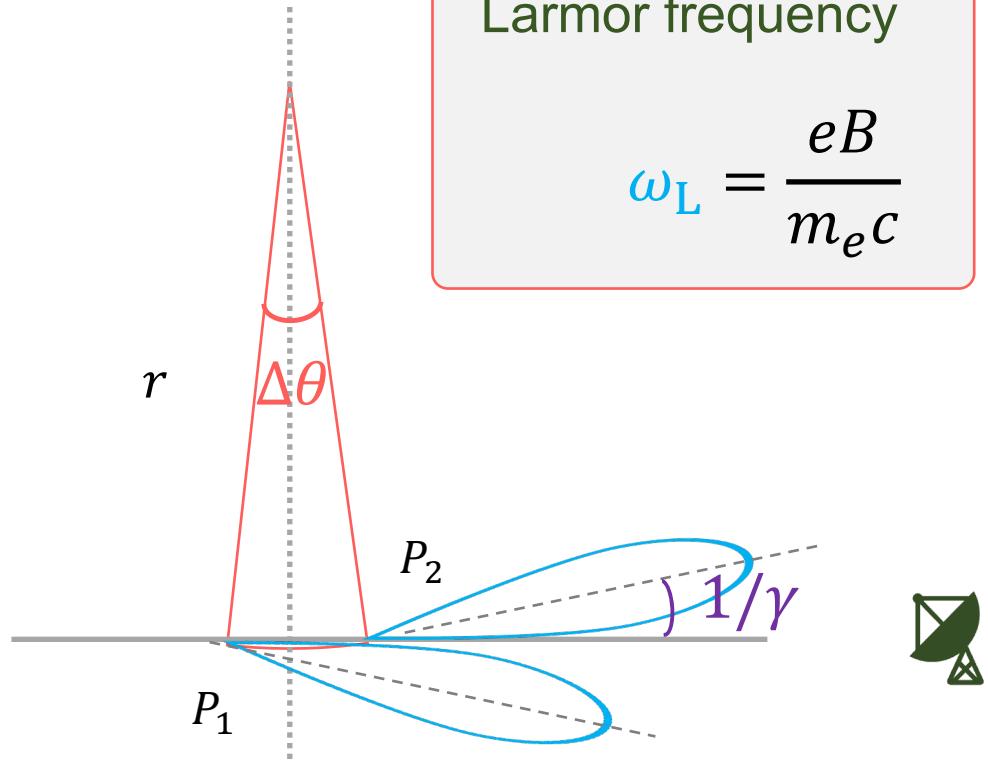

$$\Delta t = \frac{\gamma m_e c \Delta\theta}{e B \sin \alpha} = \frac{\gamma \Delta\theta}{\omega_L \sin \alpha} = \frac{2}{\omega_L \sin \alpha}$$

Sect. 4.1.2 of 《天体物理中的辐射机制》 by 尤峻汉 (p156)

$$P(\alpha) = \frac{2}{3} c r_0^2 \beta^2 \gamma^2 B^2 \sin^2 \alpha$$

prev. sl.

$$\langle \sin^2 \alpha \rangle = = \frac{2}{3}$$

If the velocity distribution of the electrons is **isotropic**, we have

$$\langle P \rangle = \frac{4}{9} c r_0^2 \gamma^2 \beta^2 B^2 = \frac{4}{3} \sigma_T c \beta^2 \gamma^2 U_B$$

$$= 1.058 \times 10^{-15} \gamma^2 \beta^2 \left(\frac{B}{G}\right)^2 \text{ erg s}^{-1}$$

Magnetic energy density

$$U_B = \frac{B^2}{8\pi}$$

Sect. 2.1 of the REF book (p51-53) by Rybicki & Lightman

Thomson scattering cross section

$$\sigma_T = \frac{8\pi r_0^2}{3} = 6.652 \times 10^{-25} \text{ cm}^{-2}$$

Spectral shape of synchrotron radiation

The observed spectrum of synchrotron radiation will spread over a wide (frequency) range

$$\frac{dP(\nu)}{d\nu} = \frac{2\pi\sqrt{3}e^2\nu_L}{c} F\left(\frac{\nu}{\nu_c}\right) \text{ erg s}^{-1}\text{Hz}^{-1} \quad F\left(\frac{\nu}{\nu_c}\right)$$

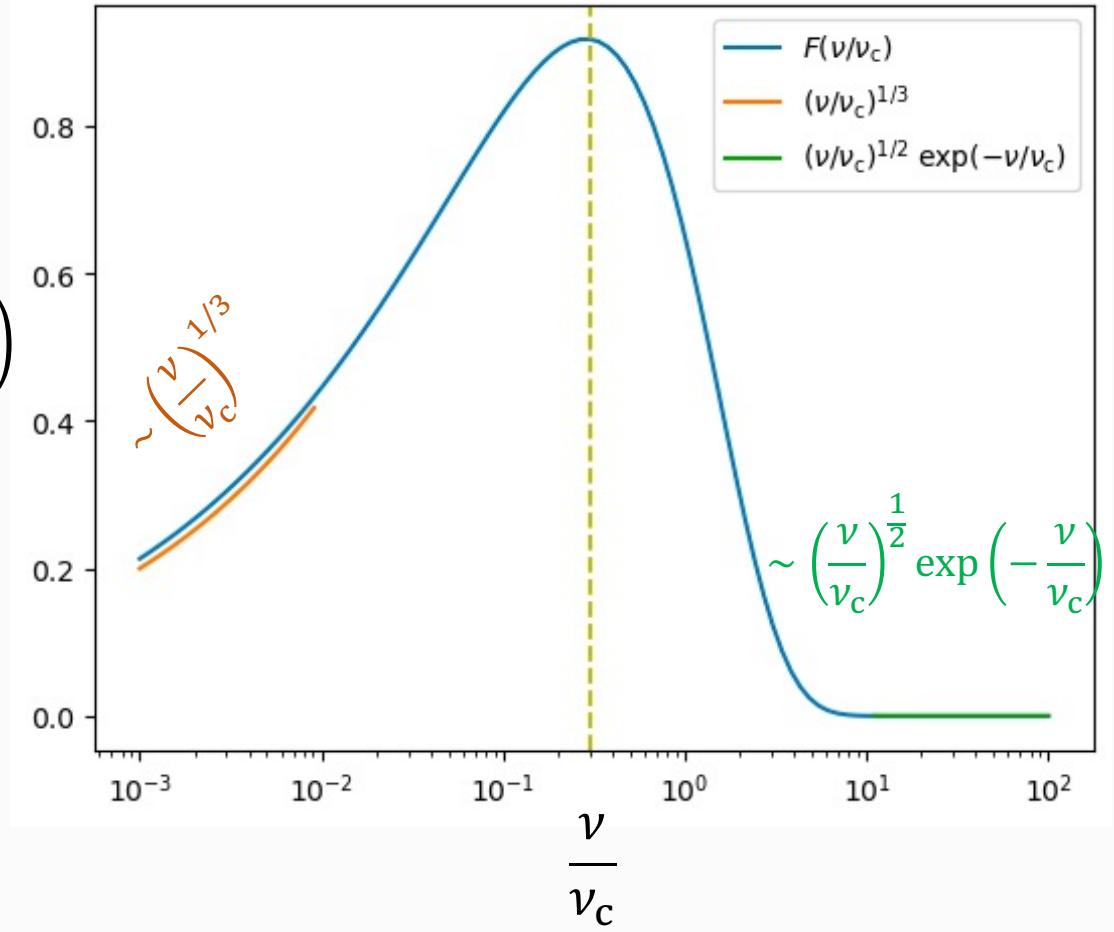

$$\nu_c = \frac{3}{2}\gamma^2\nu_L$$

$$F\left(\frac{\nu}{\nu_c}\right) = \left(\frac{\nu}{\nu_c}\right) \int_{\nu/\nu_c}^{\infty} K_{5/3}(t) dt$$

$\propto \left(\frac{\nu}{\nu_c}\right)^{1/3}$

$\propto \left(\frac{\nu}{\nu_c}\right)^{1/2} \exp\left(-\frac{\nu}{\nu_c}\right)$

modified Bessel function of the 5/3 order

see Chpt. 4.2.4 of 《天体物理中的辐射机制》 by 尤峻汉(p184-188)

Spectrum of synchrotron radiation (cont.)

The observed spectrum of synchrotron radiation will spread over a wide (frequency) range

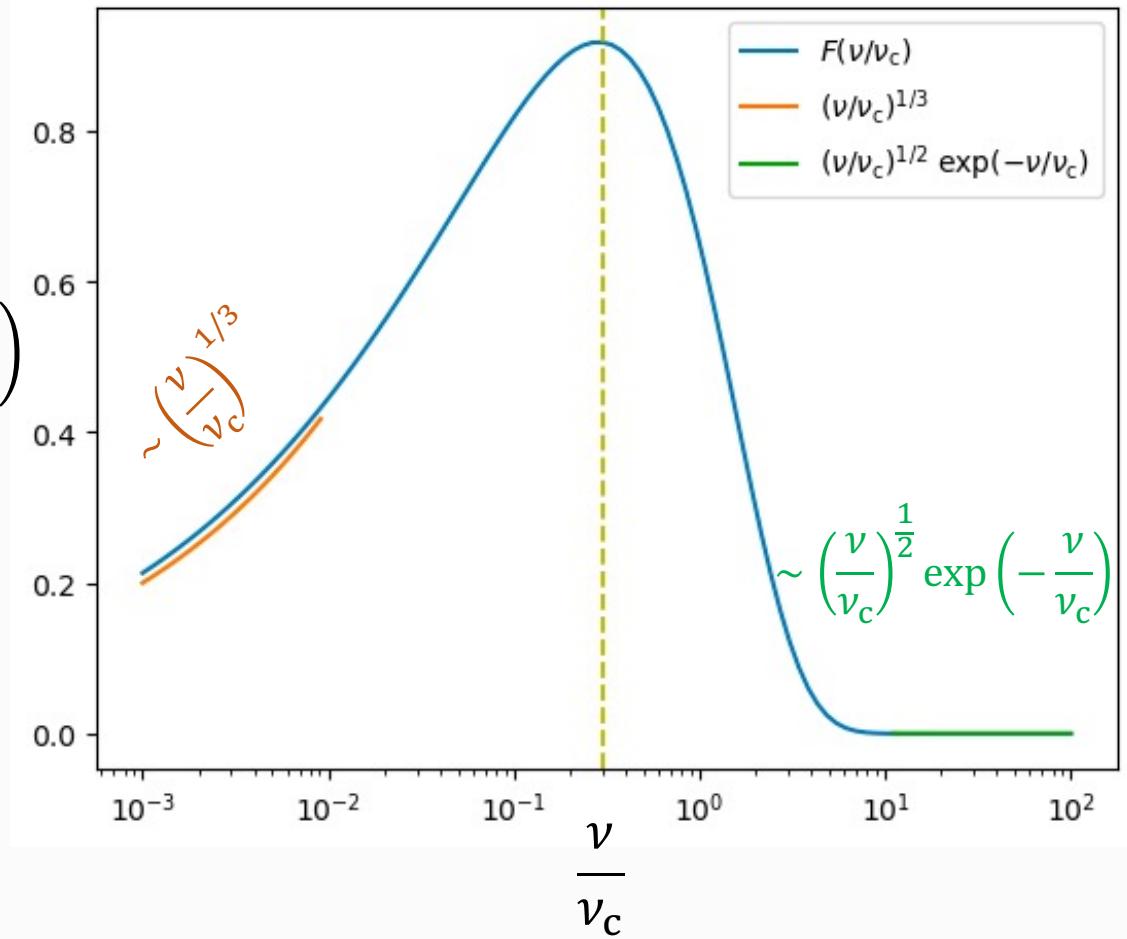

$$\frac{dP(\nu)}{d\nu} = \frac{2\pi\sqrt{3}e^2\nu_L}{c} F\left(\frac{\nu}{\nu_c}\right) \text{ erg s}^{-1}\text{Hz}^{-1} \quad F\left(\frac{\nu}{\nu_c}\right)$$

$$\nu_c = \frac{3}{2}\gamma^2\nu_L$$

Most of the energy is radiated away at the frequency

$$\nu_{\text{peak}} \sim 0.3\nu_c \sim 0.45\gamma^2\nu_L$$

$$\sim 1.256 \times 10^6 \gamma^2 \left(\frac{B}{G}\right) \text{ Hz}$$

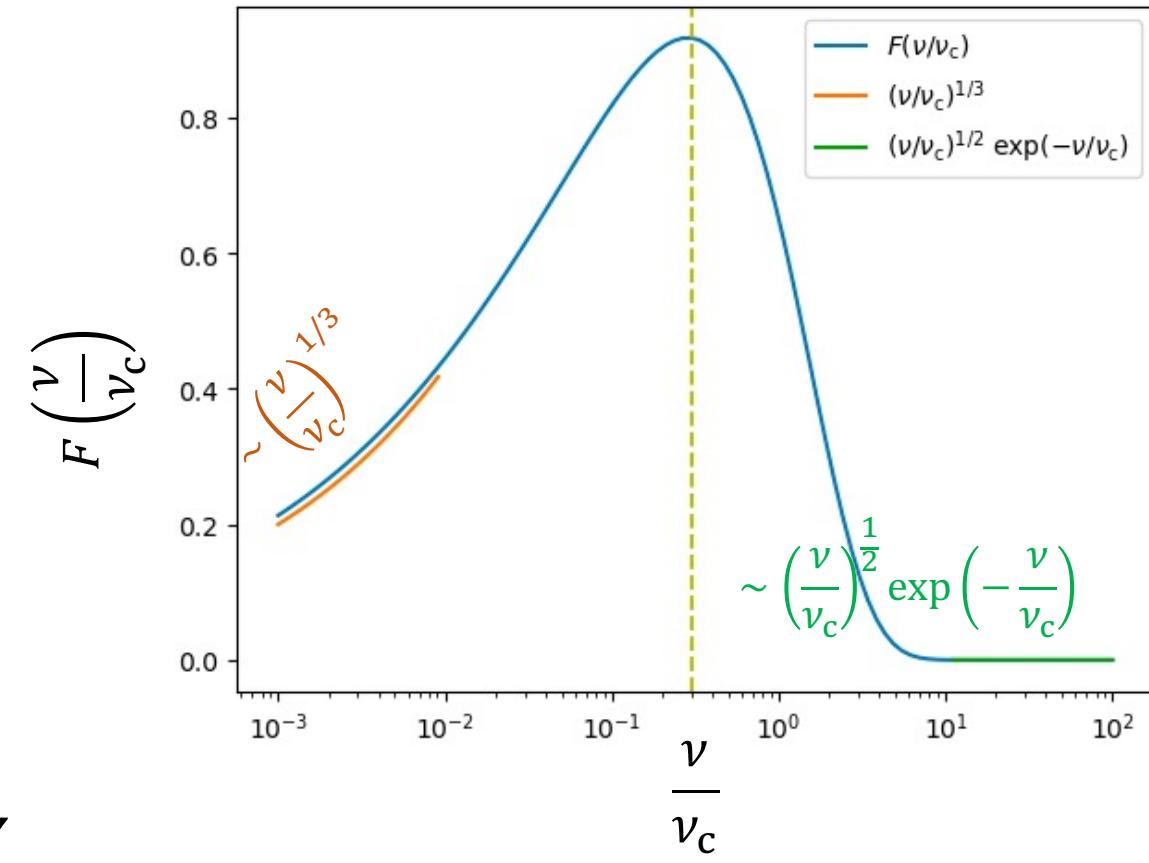

see Chpt. 4.2.4 of 《天体物理中的辐射机制》 by 尤峻汉(p184-188)

Synchrotron spectrum of power law electron distribution

Previous slides are limited to properties of a single relativistic electron. The observed spectral properties come from a large population of relativistic electrons with a power law energy distribution

$$N(\gamma)d\gamma \propto \gamma^{-p}d\gamma, \gamma_{\min} < \gamma < \gamma_{\max}$$

$$P(\nu) \propto P(\nu)\gamma^{-p}d\gamma \propto \int_{\gamma_{\min}}^{\gamma_{\max}} F\left(\frac{\nu}{\nu_c}\right)\gamma^{-p}d\gamma$$

Each single relativistic electron with γ gives rise to a broad emission “bump”

Synchrotron spectrum (cont.)

prev. sl.

$$P(\nu) \propto P(\nu) \gamma^{-p} d\gamma \propto \int_{\gamma_{\min}}^{\gamma_{\max}} F\left(\frac{\nu}{\nu_c}\right) \gamma^{-p} d\gamma$$

$$P(\nu) \propto \nu^{-(p-1)/2} \int_{x_{\min}}^{x_{\max}} F(x) x^{(p-3)/2} dx$$

If $x_{\min} \rightarrow 0$ and $x_{\max} \rightarrow \infty$

$$\int_0^\infty F(x) x^{(p-3)/2} dx \sim \text{const.}$$

$$P(\nu) \propto \nu^{-(p-1)/2}$$

prev. sl.

$$\frac{dP(\nu)}{d\nu} \propto F\left(\frac{\nu}{\nu_c}\right)$$

$$\nu_c = \frac{3}{2} \gamma^2 \nu_L$$

$$x = \frac{\nu}{\nu_c} \propto \frac{\nu}{\gamma^2}, \gamma \propto \left(\frac{\nu}{x}\right)^{\frac{1}{2}}$$

$$d\nu \propto -\frac{1}{2} \frac{\nu^{1/2}}{x^{3/2}} dx$$

Polarization of synchrotron radiation

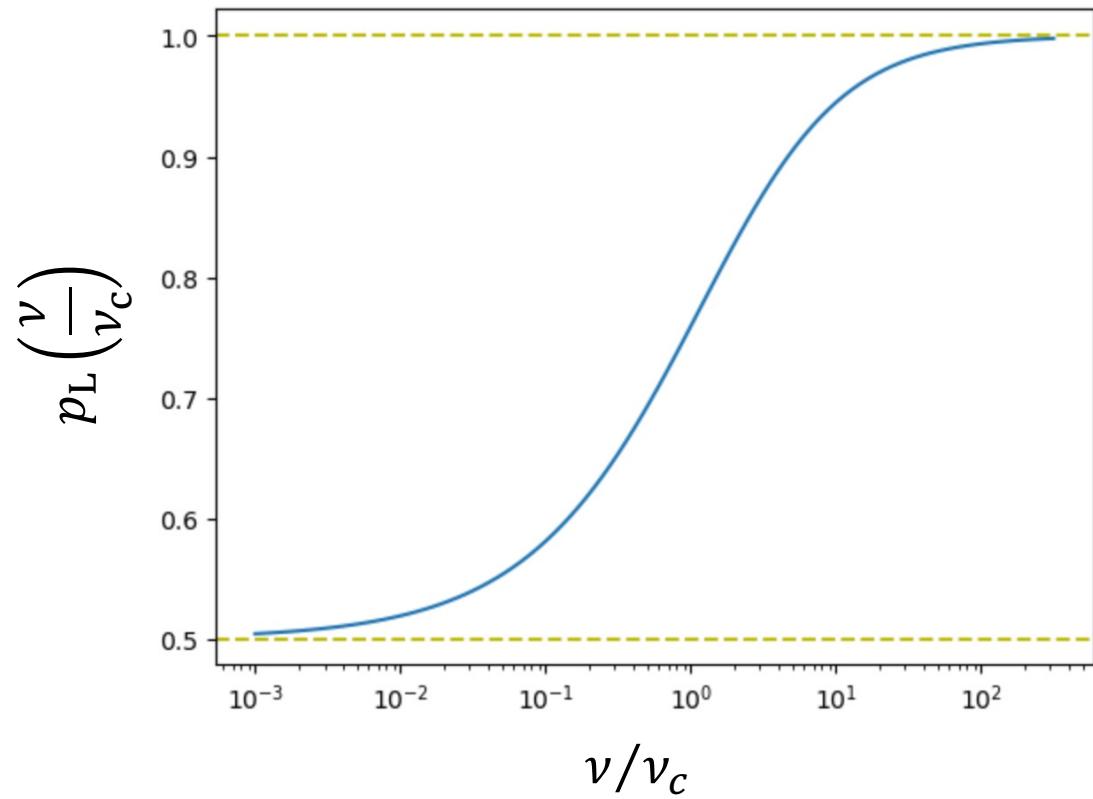

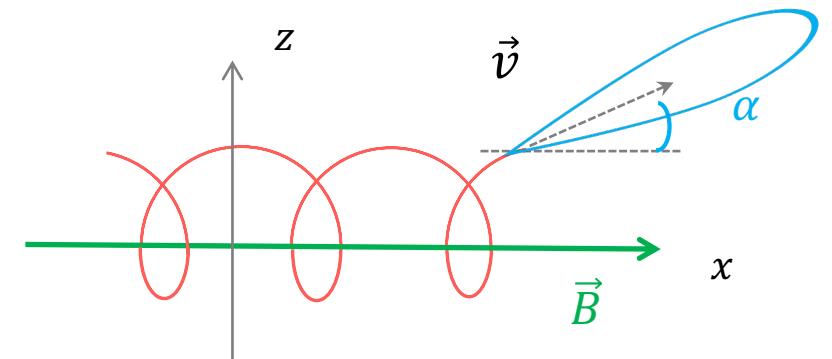

For a population of relativistic electrons with the same γ factor but different radiation angle $\theta \simeq \alpha \pm 1/\gamma$, the synchrotron radiation is linearly polarized

$$p_L = \frac{K_{2/3}(\nu/\nu_c)}{\int_{\nu/\nu_c}^{\infty} K_{5/3}(t) dt} \quad \begin{cases} 0.5 & \text{for } \nu \ll \nu_c \\ 1.0 & \text{for } \nu \gg \nu_c \end{cases}$$

Westfold (1959)

prev. sl.

$$\nu_c = \frac{3}{2} \gamma^2 \nu_L$$

Synchrotron polarization of power law electron distribution

The observed average linear polarization fraction come from a large population of relativistic electrons with a power law energy distribution

$$N(\gamma)d\gamma \propto \gamma^{-p}d\gamma, \gamma_{\min} < \gamma < \gamma_{\max}$$

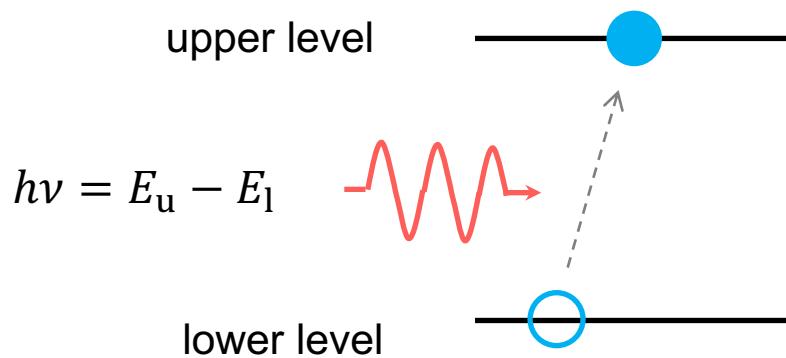

$$\langle p_L \rangle = \frac{p + 1}{p + \frac{7}{3}}$$

See Chpt. 6 of the REF
book (p180 - 181) by
Rybicki & Lightman

- ✓ The average linear polarization fraction depends only on the power-law index of the relativistic electron population.
- ✓ The average linear polarization fraction is **frequency-independent**.

Synchrotron absorption

A photon interacts with a charge in a magnetic field and is absorbed, giving up its energy to the charge

Similar to the absorption of lines (two quantum states), synchrotron self-absorption can happen between two continuum states.

Synchrotron self-absorption

Consider a power-law distribution of electrons with $N(\gamma)d\gamma \propto \gamma^{-p}d\gamma$, for $h\nu \ll \gamma m_0 c^2$, the absorption coefficient and source function of synchrotron radiation

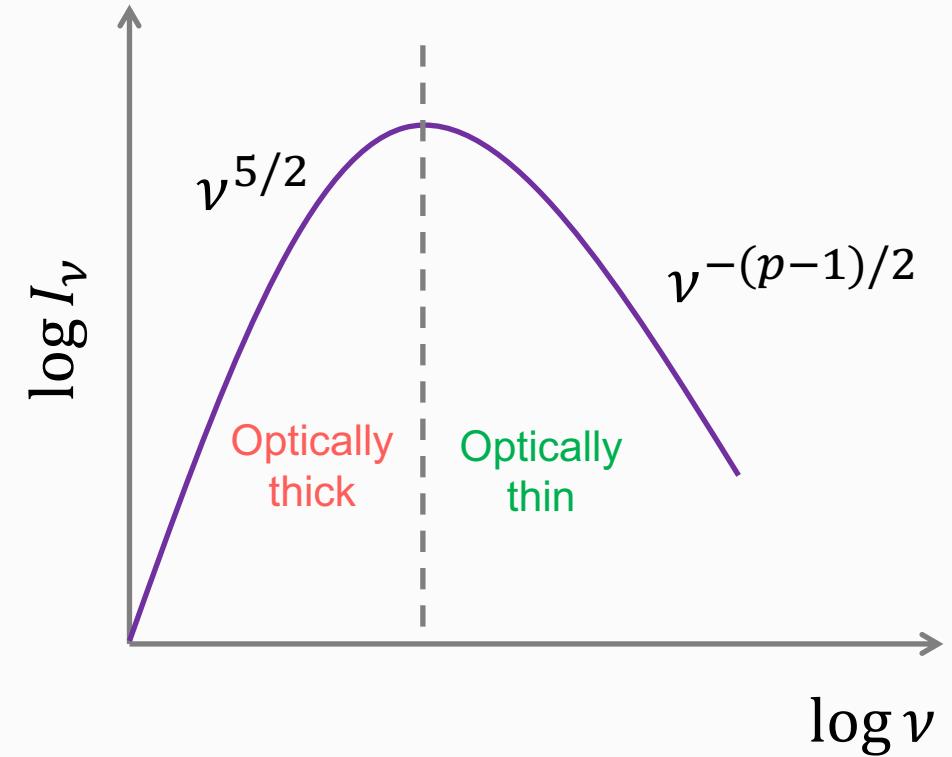

$$j_\nu = P_\nu$$

$$\alpha_\nu \propto \nu^{-(p+4)/2}$$

$$S_\nu = \frac{j_\nu}{\alpha_\nu} = \frac{P_\nu}{4\pi \alpha_\nu} \propto \nu^{5/2}$$

See Chpt. 6 of the REF book (p186-190) by Rybicki & Lightman

$$I_\nu \propto \begin{cases} P_\nu, & \text{optically thin} \\ S_\nu, & \text{optically thick} \end{cases}$$

prev. sl.

$$P(\nu) \propto \nu^{-(p-1)/2}$$

Lifetime of synchrotron radiation

For a relativistic electron with initial kinetic energy $E_0 = \gamma_0 m_e c^2$, it can lose energy via synchrotron radiation

$$\frac{d}{dt}(\gamma m_e c^2) = -P_{\text{syn}} = -\frac{2}{3} \frac{e^4}{m_e^2 c^3} \frac{v^2}{c^2} B^2 \gamma^2 \sin^2 \alpha$$

$$= -A m_e c^2 (1 - \gamma^{-2}) \gamma^2$$

$$\frac{d\gamma}{dt} = -A (\gamma^2 - 1) \sim -A \gamma^2 \text{ for } \gamma \gg 1$$

$$-\gamma^2 d\gamma \sim A dt$$

$$\gamma(t) = \frac{\gamma_0}{1 + A \gamma_0 t}$$

prev. sl.

$$P_{\text{syn}}(\alpha) = \frac{2}{3} c r_0^2 \beta^2 \gamma^2 B^2 \sin^2 \alpha$$

classical electron radius

$$r_0 = \frac{e^2}{m_e c^2}$$

$$\frac{v^2}{c^2} = 1 - \gamma^{-2}$$

$$A = \frac{2}{3} \frac{e^4}{m_e^3 c^5} B^2 \sin^2 \alpha$$

$$\frac{1}{\gamma(t)} - \frac{1}{\gamma_0} = At$$

Half-energy lifetime due to synchrotron radiation

For a relativistic electron with initial kinetic energy $E_0 = \gamma_0 m_e c^2$ and emits synchrotron radiation, the half-energy lifetime is

$$\frac{\gamma_0}{2} = \frac{\gamma_0}{1 + A \gamma_0 t_{\text{syn},1/2}}$$

$$t_{\text{syn},1/2} = \frac{1}{\gamma_0 A} = \frac{3m_e^3 c^5}{2e^4} \frac{1}{\gamma_0} B^{-2} (\sin \alpha)^{-2}$$

$$\sim 5.16 \times 10^8 \frac{1}{\gamma_0} \left(\frac{B}{G}\right)^{-2} (\sin \alpha)^{-2} \text{ s}$$

$$t_{\text{syn},1/2} = 5.78 \times 10^{11} \left(\frac{\nu_{\text{peak}}}{\text{Hz}}\right)^{-\frac{1}{2}} \left(\frac{B}{G}\right)^{-3/2} (\sin \alpha)^{-2} \text{ s}$$

prev. sl.

$$\gamma(t) = \frac{\gamma_0}{1 + A \gamma_0 t}$$

$$A = \frac{2e^4 B^2 \sin^2 \alpha}{3 m_e^3 c^5}$$

prev. sl.

$$\nu_{\text{peak}} \sim 1.256 \times 10^6 \gamma^2 \left(\frac{B}{G}\right) \text{ Hz}$$

Requirement of synchrotron radiation

To ensure the energy loss is negligible in a specific cycle, the following requirement needs to be met on $t_{\text{syn},1/2}$ and the period of circular motion $T = 2\pi/\omega_0$

prev. sl.

$$t_{\text{syn},1/2} = \frac{1}{\gamma_0 A} = \frac{3m_e^3 c^5}{2e^4} \frac{1}{\gamma_0} B^{-2} (\sin \alpha)^{-2}$$

$$\frac{2\pi}{\omega_0 t_{\text{syn},1/2}} = \frac{2\pi\gamma_0}{\omega_L} \frac{2e^4\gamma_0 B^2 \sin^2 \alpha}{3m_e^3 c^5} = \frac{4\pi e^3}{3m_e^2 c^4} \gamma_0^2 B \sin^2 \alpha$$

$$\sim 6.93 \times 10^{-16} \gamma_0^2 \left(\frac{B}{G}\right) \sin^2 \alpha \ll 1$$

prev. sl.

$$\nu_{\text{peak}} \sim 1.256 \times 10^6 \gamma^2 \left(\frac{B}{G}\right) \text{ Hz}$$

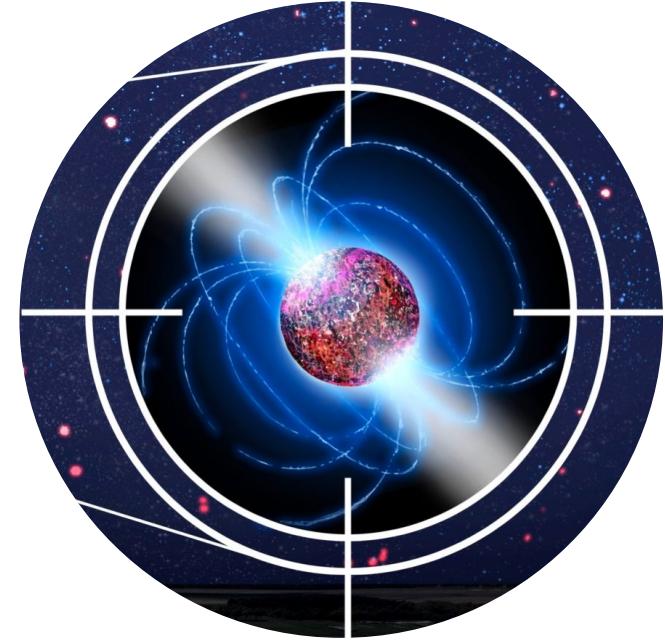

If $\nu_{\text{peak}} \ll 10^{21} \text{ Hz}$, the above requirement can be met

Synchrotron radiation in strong B -fields

prev. sl.

$$t_{\text{syn},1/2} \sim 5.78 \times 10^8 \gamma_0^{-1} \left(\frac{B}{G}\right)^{-2} (\sin \alpha)^{-2} \text{ s}$$

For a neutron star with a B -field strength of 10^{12} G, if it emits synchrotron radiation with $\gamma \sim 100$, $t_{\text{syn},1/2}$ is as short as 6×10^{-18} s!

$$\frac{1}{\nu_0} \sim \frac{\gamma}{\nu_L} \sim \frac{\gamma}{2.8 \times 10^6 \left(\frac{B}{G}\right)} \text{ s}$$

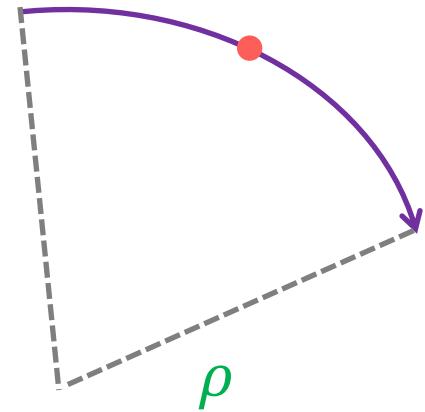

For comparison, the gyration time is $\sim 4 \times 10^{-16}$ s.

Curvature process

If the pitch angle α is not too small, the relativistic electron still has a velocity component along the B -field line.

For curved B -field lines, such a process can give rise to curvature radiation. The instantaneous behavior is similar to synchrotron radiation.

(curved) B -field line

$$\nu_0^{\text{crv}} \simeq \frac{c}{2\pi\rho} \quad \leftarrow \text{(instantaneous) curvature radius}$$

$$\nu_0^{\text{syn}} = \frac{c}{2\pi r_0} \quad \leftarrow \text{radius of the helical motion}$$

Decomposing the kinetic energy of relativistic electrons along the B -field line ($K_{E,\parallel}$) and perpendicular to the B -field line ($K_{E,\perp}$). Curvature radiation consumes $K_{E,\parallel}$ while synchrotron radiation consumes $K_{E,\perp}$.
